MVI56-HART User Manual

October 13, 2011

ProSoft Technology <sup>®</sup>, ProLinx <sup>®</sup>, inRAx <sup>®</sup>, ProTalk <sup>®</sup>, and RadioLinx <sup>®</sup> are Registered Trademarks of ProSoft Technology, Inc. All other brand or product names are or may be trademarks of, and are used to identify products and services of, their respective owners.

# **ProSoft Technology® Product Documentation**

In an effort to conserve paper, ProSoft Technology no longer includes printed manuals with our product shipments. User Manuals, Datasheets, Sample Ladder Files, and Configuration Files are provided on the enclosed CD-ROM in Adobe<sup>®</sup> Acrobat Reader file format (.PDFs). These product documentation files may also be freely downloaded from our web site: www.prosoft-technology.com

## Important Installation Instructions

Power, Input, and Output (I/O) wiring must be in accordance with Class I, Division 2 wiring methods, Article 501-4 (b) of the National Electrical Code, NFPA 70 for installation in the U.S., or as specified in Section 18-1J2 of the Canadian Electrical Code for installations in Canada, and in accordance with the authority having jurisdiction. The following warnings must be heeded:

**WARNING** - EXPLOSION HAZARD - SUBSTITUTION OF COMPONENTS MAY IMPAIR SUITABILITY FOR CLASS I, DIV. 2;

**WARNING** - EXPLOSION HAZARD - WHEN IN HAZARDOUS LOCATIONS, TURN OFF POWER BEFORE REPLACING OR WIRING MODULES

**WARNING** - EXPLOSION HAZARD - DO NOT DISCONNECT EQUIPMENT UNLESS POWER HAS BEEN SWITCHED OFF OR THE AREA IS KNOWN TO BE NON-HAZARDOUS. THIS DEVICE SHALL BE POWERED BY CLASS 2 OUTPUTS ONLY.

# **MVI (Multi Vendor Interface) Modules**

WARNING - EXPLOSION HAZARD - DO NOT DISCONNECT EQUIPMENT UNLESS POWER HAS BEEN SWITCHED OFF OR THE AREA IS KNOWN TO BE NON-HAZARDOUS.

AVERTISSEMENT - RISQUE D'EXPLOSION - AVANT DE DÉCONNECTER L'ÉQUIPEMENT, COUPER LE COURANT OU S'ASSURER QUE L'EMPLACEMENT EST DÉSIGNÉ NON DANGEREUX.

### **Warnings**

### **North America Warnings**

Power, Input, and Output (I/O) wiring must be in accordance with Class I, Division 2 wiring methods, Article 501-4 (b) of the National Electrical Code, NFPA 70 for installation in the U.S., or as specified in Section 18-1J2 of the Canadian Electrical Code for installations in Canada, and in accordance with the authority having jurisdiction. The following warnings must be heeded:

- A Warning Explosion Hazard Substitution of components may impair suitability for Class I, Division 2.
- **B** Warning Explosion Hazard When in hazardous locations, turn off power before replacing or rewiring modules.
- **C** Warning Explosion Hazard Do not disconnect equipment unless power has been switched off or the area is known to be non-hazardous.
  - Avertissement Risque d'explosion Avant de déconnecter l'équipement, couper le courant ou s'assurer que l'emplacement est désigné non dangereux.
- D Suitable for use in Class I, Division 2 Groups A, B, C and D Hazardous Locations or Non-Hazardous Locations.

#### **ATEX Warnings and Conditions of Safe Usage**

Power, Input, and Output (I/O) wiring must be in accordance with the authority having jurisdiction.

- A Warning Explosion Hazard When in hazardous locations, turn off power before replacing or wiring modules.
- **B** Warning Explosion Hazard Do not disconnect equipment unless power has been switched off or the area is known to be non-hazardous.
- C These products are intended to be mounted in an IP54 enclosure. The devices shall provide external means to prevent the rated voltage being exceeded by transient disturbances of more than 40%. This device must be used only with ATEX certified backplanes.
- D DO NOT OPEN WHEN ENERGIZED.

### **Battery Life Advisory**

The MVI46, MVI56, MVI56E, MVI69, and MVI71 modules use a rechargeable Lithium Vanadium Pentoxide battery to backup the real-time clock and CMOS. The battery should last for the life of the module. The module must be powered for approximately twenty hours before the battery becomes fully charged. After it is fully charged, the battery provides backup power for the CMOS setup and the real-time clock for approximately 21 days. When the battery is fully discharged, the module will revert to the default BIOS and clock settings.

**Note:** The battery is not user replaceable.

# **Markings**

## **Electrical Ratings**

- Backplane Current Load: 800 mA @ 5.1 Vdc; 3 mA @ 24 Vdc
- Operating Temperature: 0°C to 60°C (32°F to 140°F)
- Storage Temperature: -40 °C to 85 °C (-40 °F to 185 °F)
- Shock: 30 g, operational; 50 g, non-operational; Vibration: 5 g from 10 Hz to 150 Hz
- Relative Humidity: 5% to 95% with no condensation
- All phase conductor sizes must be at least 1.3 mm(squared) and all earth ground conductors must be at least 4mm(squared).

## In This Chapter

*	System Requirements	. 14
*	Package Contents	. 15
*	Installing ProSoft Configuration Builder Software	. 16
*	Setting Jumpers	. 17
*	Installing the Module in the Rack	. 18
*	Connecting Your PC to the ControlLogix Processor	. 20
*	Using the Sample Ladder Logic	.21
*	Downloading the Sample Program to the Processor	. 26
*	Connecting Your PC to the Module	.27

To get the most benefit from this User Manual, you should have the following skills:

- Rockwell Automation<sup>®</sup> RSLogix™ software: launch the program, configure ladder logic, and transfer the ladder logic to the processor
- Microsoft Windows: install and launch programs, execute menu commands, navigate dialog boxes, and enter data
- Hardware installation and wiring: install the module, and safely connect HART and ControlLogix devices to a power source and to the MVI56-HART module's application port(s)

# 1.1 System Requirements

The MVI56-HART module requires the following minimum hardware and software components:

- Rockwell Automation ControlLogix<sup>™</sup> processor, with compatible power supply and one free slot in the rack, for the MVI56-HART module. The module requires 800 mA of available power.
- Rockwell Automation RSLogix 5000 programming software version 2.51 or higher
- Rockwell Automation RSLinx communication software
- Pentium<sup>®</sup> II 450 MHz minimum. Pentium III 733 MHz (or better) recommended
- Supported operating systems:
  - Microsoft Windows XP Professional with Service Pack 1 or 2
  - o Microsoft Windows 2000 Professional with Service Pack 1, 2, or 3
  - Microsoft Windows Server 2003
- 128 Mbytes of RAM minimum, 256 Mbytes of RAM recommended
- 100 Mbytes of free hard disk space (or more based on application requirements)
- 256-color VGA graphics adapter, 800 x 600 minimum resolution (True Color 1024 □ 768 recommended)
- CD-ROM drive
- ProSoft Configuration Builder, HyperTerminal or other terminal emulator program.

**Note:** You can install the module in a local or remote rack. For remote rack installation, the module requires EtherNet/IP or ControlNet communication with the processor.

# 1.2 Package Contents

The following components are included with your MVI56-HART module, and are all required for installation and configuration.

**Important:** Before beginning the installation, please verify that all of the following items are present.

Qty.	Part Name	Part Number	Part Description				
1	MVI56-HART Module	MVI56-HART	HART Multi-drop Master Communication Module				
1	Cable	Cable #15, RS232 Null Modem	For RS232 Connection to the CFG Port				
1	Cable	Cable #14, RJ45 to DB9 Male Adapter cable	For DB9 Connection to Module's Port				

If any of these components are missing, please contact ProSoft Technology Support for replacement parts.

# 1.3 Installing ProSoft Configuration Builder Software

You must install the *ProSoft Configuration Builder (PCB)* software to configure the module. You can always get the newest version of *ProSoft Configuration Builder* from the ProSoft Technology website.

#### To install ProSoft Configuration Builder from the ProSoft Technology website

- 1 Open your web browser and navigate to http://www.prosoft-technology.com/pcb
- 2 Click the link at the *Current Release Version* section to download the latest version of *ProSoft Configuration Builder*.
- 3 Choose SAVE or SAVE FILE when prompted.
- 4 Save the file to your *Windows Desktop*, so that you can find it easily when you have finished downloading.
- **5** When the download is complete, locate and open the file, and then follow the instructions on your screen to install the program.

If you do not have access to the Internet, you can install *ProSoft Configuration Builder* from the *ProSoft Solutions Product CD-ROM*, included in the package with your module.

#### To install ProSoft Configuration Builder from the Product CD-ROM

- 1 Insert the *ProSoft Solutions Product CD-ROM* into the CD-ROM drive of your PC. Wait for the startup screen to appear.
- 2 On the startup screen, click **PRODUCT DOCUMENTATION**. This action opens a *Windows Explorer* file tree window.
- 3 Click to open the **UTILITIES** folder. This folder contains all of the applications and files you will need to set up and configure your module.
- 4 Double-click the **SETUP CONFIGURATION TOOL** folder, double-click the **PCB\_\*.EXE** file and follow the instructions on your screen to install the software on your PC. The information represented by the "\*" character in the file name is the *PCB* version number and, therefore, subject to change as new versions of *PCB* are released.

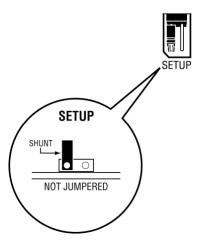

**Note:** Many of the configuration and maintenance procedures use files and other utilities on the CD-ROM. You may wish to copy the files from the *Utilities* folder on the CD-ROM to a convenient location on your hard drive.

Page 16 of 171 ProSoft Technology, Inc.
October 13, 2011

# 1.4 Setting Jumpers

The Setup Jumper acts as "write protection" for the module's flash memory. In "write protected" mode, the Setup pins are not connected, and the module's firmware cannot be overwritten. Do not jumper the Setup pins together unless you are directed to do so by ProSoft Technical Support.

The following illustration shows the MVI56-HART jumper configuration.

**Note:** If you are installing the module in a remote rack, you may prefer to leave the Setup pins jumpered. That way, you can update the module's firmware without requiring physical access to the module.

# 1.5 Installing the Module in the Rack

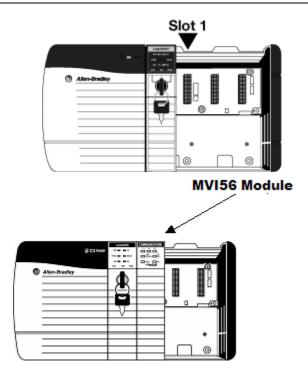

If you have not already installed and configured your ControlLogix processor and power supply, please do so before installing the MVI56-HART module. Refer to your Rockwell Automation product documentation for installation instructions.

**Warning:** You must follow all safety instructions when installing this or any other electronic devices. Failure to follow safety procedures could result in damage to hardware or data, or even serious injury or death to personnel. Refer to the documentation for each device you plan to connect to verify that suitable safety procedures are in place before installing or servicing the device.

After you have checked the placement of the jumpers, insert MVI56-HART into the ControlLogix chassis. Use the same technique recommended by Rockwell Automation to remove and install ControlLogix modules.

**Warning:** When you insert or remove the module while backplane power is on, an electrical arc can occur. This could cause an explosion in hazardous location installations. Verify that power is removed or the area is non-hazardous before proceeding. Repeated electrical arcing causes excessive wear to contacts on both the module and its mating connector. Worn contacts may create electrical resistance that can affect module operation.

- 1 Turn power OFF.
- 2 Align the module with the top and bottom guides, and slide it into the rack until the module is firmly against the backplane connector.

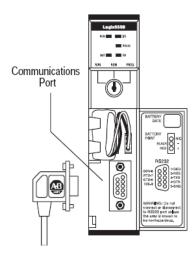

- 3 With a firm but steady push, snap the module into place.
- 4 Check that the holding clips on the top and bottom of the module are securely in the locking holes of the rack.
- Make a note of the slot location. You must identify the slot in which the module is installed in order for the sample program to work correctly. Slot numbers are identified on the green circuit board (backplane) of the ControlLogix rack.
- 6 Turn power ON.

**Note:** If you insert the module improperly, the system may stop working, or may behave unpredictably.

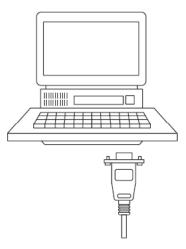

# 1.6 Connecting Your PC to the ControlLogix Processor

There are several ways to establish communication between your PC and the ControlLogix processor. The following steps show how to establish communication through the serial interface. It is not mandatory that you use the processor's serial interface. You may access the processor through whatever network interface is available on your system. Refer to your Rockwell Automation documentation for information on other connection methods.

1 Connect the right-angle connector end of the cable to your controller at the communications port.

2 Connect the straight connector end of the cable to the serial port on your computer.

# 1.7 Using the Sample Ladder Logic

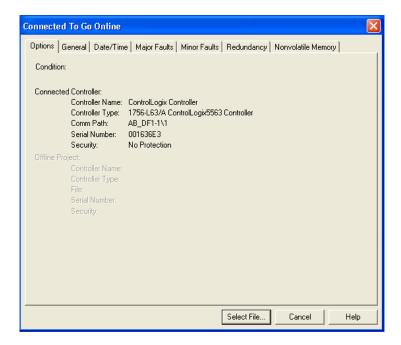

The sample program for your MVI56-HART module includes custom tags, data types, and ladder logic for data I/O and status monitoring. For most applications, you can run the sample ladder program without modification, or, for advanced applications, you can incorporate the sample program into your existing application.

The *inRAx Solutions CD* provides one or more versions of the sample ladder logic. The version number appended to the file name corresponds with the firmware version number of your ControlLogix processor. The firmware version and sample program version must match.

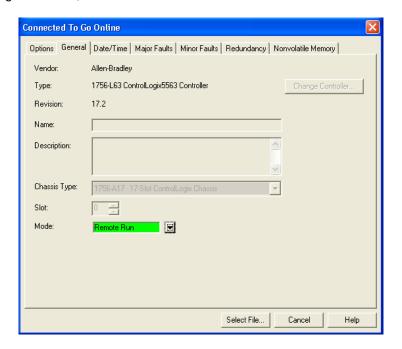

# 1.7.1 Determining the Firmware Version of Your Processor

**Important:** The RSLinx service must be installed and running on your computer in order for RSLogix to communicate with the processor. Refer to your RSLinx and RSLogix documentation for help configuring and troubleshooting these applications.

- 1 Connect an RS-232 serial cable from the COM (serial) port on your PC to the communication port on the front of the processor.
- 2 Start RSLogix 5000 and close any existing project that may be loaded.
- **3** Open the **COMMUNICATIONS** menu and choose **GO ONLINE**. RSLogix will establish communication with the processor. This may take a few moments.
- 4 When RSLogix has established communication with the processor, the *Connected To Go Online* dialog box will open.

5 In the *Connected To Go Online* dialog box, click the **GENERAL** tab. This tab shows information about the processor, including the *Revision* (firmware) version. In the following illustration, the firmware version is 17.2.

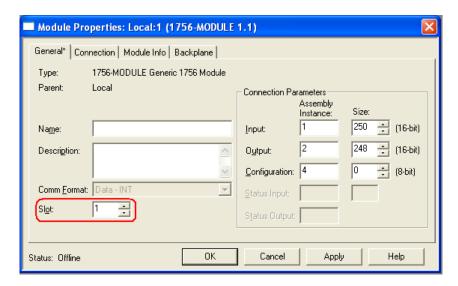

# 1.7.2 Selecting the Slot Number for the Module

This sample application is for a module installed in Slot 1 in a ControlLogix rack. The ladder logic uses the slot number to identify the module. If you are installing the module in a different slot, you must update the ladder logic so that program tags and variables are correct, and do not conflict with other modules in the rack.

### To change the slot number

- In the *Controller Organization* list, select the module and then click the right mouse button to open a shortcut menu.
- **2** On the shortcut menu, choose **PROPERTIES**. This action opens the *Module Properties* dialog box.

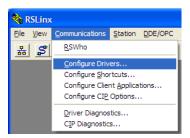

3 In the *Slot* field, use the spinners on the right side of the field to select the slot number where the module will reside in the rack, and then click **OK**.

RSLogix will automatically apply the slot number change to all tags, variables and ladder logic rungs that use the MVI56-HART slot number for computation.

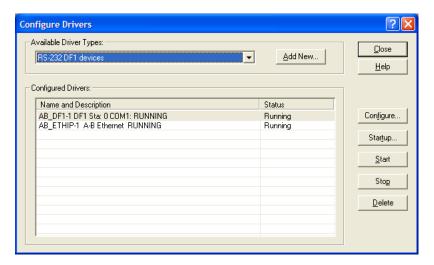

# 1.7.3 Configuring the RSLinx Driver for the PC COM Port

If RSLogix is unable to establish communication with the processor, follow these steps.

- 1 Open RSLinx.
- 2 Open the COMMUNICATIONS menu, and choose CONFIGURE DRIVERS.

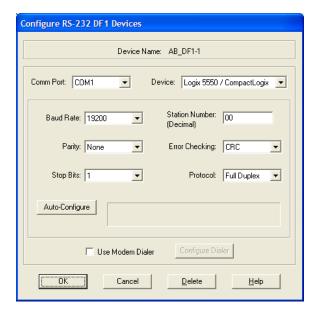

This action opens the Configure Drivers dialog box.

**Note:** If the list of configured drivers is blank, you must first choose and configure a driver from the *Available Driver Types* list. The recommended driver type to choose for serial communication with the processor is *RS-232 DF1 Devices*.

3 Click to select the driver, and then click **Configure**. This action opens the *Configure RS-232 DF1 Devices* dialog box.

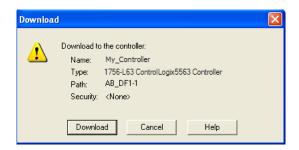

- 4 Click the **Auto-Configure** button. RSLinx will attempt to configure your serial port to work with the selected driver.
- **5** When you see the message *Auto Configuration Successful*, click the **OK** button to dismiss the dialog box.

**Note:** If the auto-configuration procedure fails, verify that the cables are connected correctly between the processor and the serial port on your computer, and then try again. If you are still unable to auto-configure the port, refer to your RSLinx documentation for further troubleshooting steps.

# 1.8 Downloading the Sample Program to the Processor

**Note:** The key switch on the front of the ControlLogix processor must be in the REM or PROG position.

- 1 If you are not already online with the processor, open the *Communications* menu, and then choose **DOWNLOAD**. RSLogix 5000 will establish communication with the processor. You do not have to download through the processor's serial port, as shown here. You may download through any available network connection.
- **2** When communication is established, RSLogix 5000 will open a confirmation dialog box. Click the **DOWNLOAD** button to transfer the sample program to the processor.

- 3 RSLogix 5000 will compile the program and transfer it to the processor. This process may take a few minutes.
- When the download is complete, RSLogix 5000 will open another confirmation dialog box. If the key switch is in the REM position, click **OK** to switch the processor from PROGRAM mode to RUN mode.

**Note:** If you receive an error message during these steps, refer to your RSLogix documentation to interpret and correct the error.

# 1.9 Connecting Your PC to the Module

With the module securely mounted, connect your PC to the Configuration/Debug port using the RJ45-DB-9 Serial Adapter Cable and the Null Modem Cable included in the package with the MVI56-HART module.

- 1 Connect the RJ45-DB-9 Serial Adapter Cable to the Null Modem Cable.
- 2 Insert the RJ45 cable connector from the RJ45-DB-9 cable into the Configuration/Debug port of the module.
- **3** Attach the other end to the serial port on your PC.

# **2 Configuring the MVI56-HART Module**

# In This Chapter

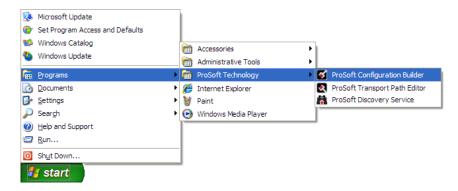

*	Using ProSoft Configuration Builder	30
*	MVI56-HART Configuration File	34
*	Hart Command Examples	4
*	Downloading the Project to the Module Using a Serial COM Port	49

# 2.1 Using ProSoft Configuration Builder

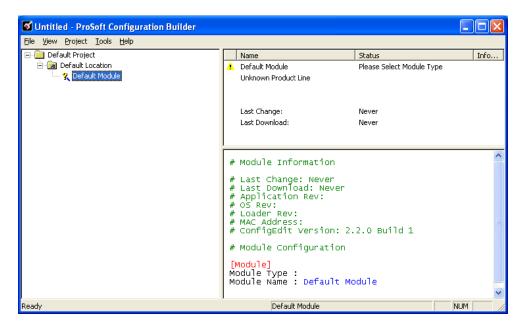

*ProSoft Configuration Builder (PCB)* provides a convenient way to manage module configuration files customized to meet your application needs. *PCB* is not only a powerful solution for new configuration files, but also allows you to import information from previously installed (known working) configurations to new projects.

# 2.1.1 Setting Up the Project

To begin, start **ProSoft Configuration Builder** (PCB).

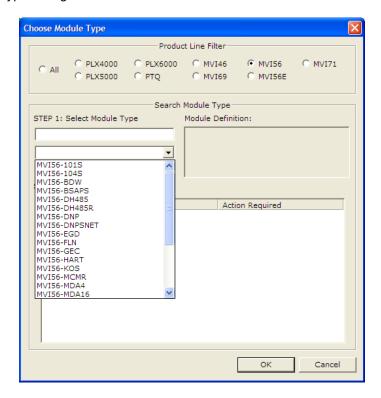

If you have used other Windows configuration tools before, you will find the screen layout familiar. *PCB*'s window consists of a tree view on the left, and an information pane and a configuration pane on the right side of the window. When you first start *PCB*, the tree view consists of folders for *Default Project* and *Default Location*, with a *Default Module* in the *Default Location* folder. The following illustration shows the *PCB* window with a new project.

### Adding the MVI56-HART module to the project

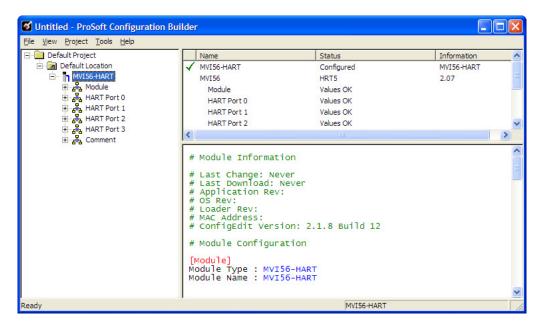

- 1 Use the mouse to select **DEFAULT MODULE** in the tree view, and then click the right mouse button to open a shortcut menu.
- 2 On the shortcut menu, choose **CHOOSE MODULE TYPE**. This action opens the *Choose Module Type* dialog box.

In the *Product Line Filter* area of the dialog box, select **MVI56**. In the *Select Module Type* dropdown list, select **MVI56-HART**, and then click **OK** to save your settings and return to the *ProSoft Configuration Builder* window.

# 2.1.2 Renaming PCB Objects

Notice that the contents of the information pane and the configuration pane changed when you added the module to the project.

At this time, you may wish to rename the *Default Project* and *Default Location* folders in the tree view.

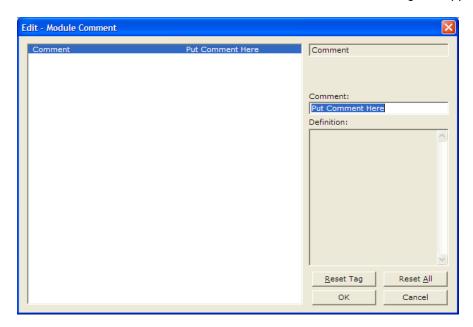

- 1 Select the object, and then click the right mouse button to open a shortcut menu. From the shortcut menu, choose **Rename**.
- 2 Type the name to assign to the object.
- **3** Click away from the object to save the new name.

### Configuring Module Parameters

- 1 Click the [+] sign next to the module icon to expand module information.
- 2 Click the [+] sign next to any icon to view module information and configuration options.
- 3 Double-click any is icon to open an Edit dialog box.
- 4 To edit a parameter, select the parameter in the left pane and make your changes in the right pane.
- 5 Click **OK** to save your changes.

### Creating Optional Comment Entries

- 1 Click the [+] to the left of the 🖽 🖧 Comment icon to expand the module comments.
- 2 Double-click the Module Comment icon. The Edit Module Comment dialog box appears.

3 Enter your comment and click **OK** to save your changes.

#### Printing a Configuration File

- 1 Select the module icon, and then click the right mouse button to open a shortcut menu.
- **2** On the shortcut menu, choose **VIEW CONFIGURATION.** This action opens the *View Configuration* window.
- 3 In the *View Configuration* window, open the **FILE** menu, and choose **PRINT**. This action opens the *Print* dialog box.
- 4 In the *Print* dialog box, choose the printer to use from the drop-down list, select printing options, and then click **OK**.

# 2.2 MVI56-HART Configuration File

The configuration file for MVI56-HART consists of the following sections.

Section	Description
[MODULE]	General module level parameters
[HART PORT 0]	HART Port (Channel) 0 configuration parameters
[HART PORT 0 COMMANDS]	HART command list for Port (Channel) 0
[HART PORT 1]	HART Port (Channel) 1 configuration parameters
[HART PORT 1 COMMANDS]	HART command list for Port (Channel) 1

# 2.2.1 [MODULE]

The [Module] section contains the data that applies to the whole module and includes the backplane data transfer parameters.

### Module Name

#### 0 to 80 characters

This parameter assigns a name to the module that can be viewed using the configuration/debug port. Use this parameter to identify the module and the configuration file.

#### Read Register Start

#### 0 to 3999

This parameter specifies the starting register address of a block of data registers to transfer from the module to the processor. This will be used for data brought into the processor from other nodes on the network.

## Write Register Count

#### 0 to 4000

This parameter specifies the number of registers to transfer from the processor to the module.

### Write Register Start

#### 0 to 3999

This parameter specifies the starting register address of a module register block where data transferred from the processor will be stored. This will be used for data to be sent from the processor to other nodes on the network.

### Write Register Count

### Range 0 to 4000

This parameter specifies the number of registers to transfer from the processor to the module. Valid entry for this parameter is 0 to 4000.

#### Error/Status Offset

-1 or 0 to 3935

This parameter defines the database location where the module status data will be stored. If set to -1, data not placed in database.

#### Failure Flag Count

### 0 through 65535

This parameter specifies the number of successive transfer errors that must occur before halting communication on the application port(s). If the parameter is set to **0**, the application port(s) will continue to operate under all conditions. If the value is set larger than **0** (**1** to **65535**), communications will cease if the specified number of failures occur.

### Initializing Output Data

#### YES or No

This parameter determines if the output data for the module should be initialized with values from the processor. If the value is set to **No** (0), the output data will be initialized to 0. If the value is set to **YES** (1), the data will be initialized with data from the processor. Setting this option to **YES** requires associated ladder logic to pass the data from the processor to the module.

# 2.2.2 [HART PORT x]

The [HART PORT *x*] sections of the configuration file set the HART channel communication parameters, define the protocol specifics and set the command list parameters. The parameters are the same for all ports. The command list for each HART channel is entered in a different section of the file.

#### Enabled

Y or N

This parameter enables or disables the specific HART channel. If the parameter is set to "Y", the channel will be utilized. If set to "N", the channel will not be used.

#### Preambles

5 to 20

This parameter sets the number of preambles to be transmitted before each message is sent from the channel. The value of 5 is normally utilized for the parameter. It can be set to a value from 5 to 20.

# Primary Master

Y or N

This parameter determines if the specific HART channel will emulate a primary or secondary master. You can have only one of each type on a HART network. If you plan on using a handheld device (secondary master), you must set the parameter to 'Y'. If the parameter is set to 'Y', the channel will act as the primary master. A value of 'N' will set the channel to act as a secondary master.

#### Retry Count

0 to 10

This parameter sets the number of retries for a command if the command response is not received from the slave device. This parameter is normally set to a value of 3. The module will accept values of 0 to 10.

### DB Address Status

-1.0 to 3999

This parameter is utilized to set the database address in the module where the status word for the channel will be placed. If the parameter is set to -1, the word value will not be placed in the database. If a value from 0 to 3999 is set for the parameter, the status word for the channel will be placed at the specified database offset. This word is bit mapped with each bit representing a slave device. The bit will be set if slave device has a communication error.

#### **Slave List Status**

The configuration parameter "DB Address Status" defines the register address in the virtual database where the status data for each HART channel will be placed. This word has one bit for each HART device and if this bit is in "1" it means that the corresponding HART device is not answering to the poll.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HART Device	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

The bit 0 of the "Slave List Status" is used for a slave connected in a point-to-point configuration. In this mode, the slave's 4 to 20 milliamp signal will also be active and can be utilized by an analog input or out module depending on the signal type.

#### Command Count

0 to 99

This parameter sets the number of user commands to be utilized. The first command in the list is always reserved for the auto-poll command so the user should configure this value considering one command for the auto-poll. For example, if the user configures two commands, the command count parameter should be set as 3. This parameter can be set from 0 to 99. If the parameter is set to a value other than 0, commands should be present in the [HART PORT x COMMANDS] section.

#### <u>Auto-Poll Code</u>

p2p, multidrop, or Not used

This parameter sets the auto-poll mode of the channel. If the parameter is set to "p2p", the module will automatically poll device 0 in point-to-point mode. If the parameter is set to "multidrop", the module will automatically poll multiple devices. If the parameter is set to "Not used", the auto-polling option will be disabled and only commands in the command list will be utilized for the channel. In the auto-poll mode, the module will automatically execute HART commands 0, 3, 13, 14, and 15.

# Auto-Poll DB Address

0 to 3700

This parameter sets the starting address for the data obtained by the auto-poll feature. Each device on a channel requires 50 words in the database. The data area selected must not overlap any portion of the database used by other channels or the module.

### Auto-Poll Swap Float

0 to 3

This parameter swaps the floating-point data values received by the auto-poll feature.

Swap Code	Description		
0	None - No Change is made in the byte ordering (1234 = 1234)		
1	Words - The words are swapped (1234=3412)		
2	Words & Bytes - The words are swapped then the bytes in each word are swapped (1234=4321)		
3	Bytes - The bytes in each word are swapped (1234=2143)		

Depending on the host processor using the data, the proper swap code must be utilized to present the data in the correct format.

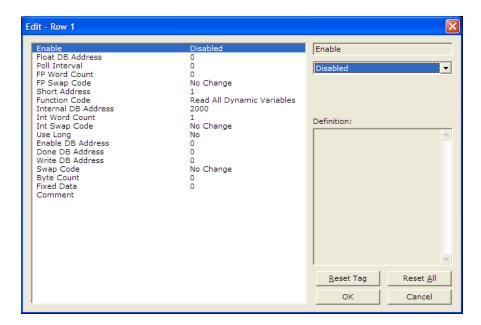

### Max Device Count

1 to 15

This parameter sets the maximum number of slave devices to be utilized for the auto-poll feature. In point-to-point mode, the parameter should be set to a value of 1. In multi-drop mode, the parameter should be set from 1 to 15 to represent the number of slave devices attached to the channel.

# 2.2.3 [HART PORT x COMMANDS]

The [HART PORT *x* COMMANDS] sections of the configuration file contain the user-defined HART command lists for each channel. The commands in these lists are sent to slave devices attached to the HART channels. The module supports up to 100 commands per channel.

#### Command List Overview

The MVI56-HART module uses a command list to interface with HART slave devices. The commands in the list specify

- the slave device to be addressed
- the function to be performed (read or write)
- the registers in the internal database to be associated with the device data.

There is a separate command list for each HART channel, with up to 100 commands allowed per channel. The command list is processed from top (Command #0) to bottom (Command #99), then the process is repeated.

A poll interval parameter is associated with each command to specify a minimum delay time in seconds between the issuance of a command. For example, a poll interval of 10 executes the command no more frequently than every 10 seconds.

Write commands have a special feature, as they can be set to execute only if the data in the write command changes. If the register data values in the command have not changed since the command was last issued, the command will not be executed. If the data in the command has changed since the command was last issued, the command will be executed. Use of this feature can lighten the load on the HART network. In order to implement this feature, set the enable code for the command to a value of 2.

The module supports all the Universal (page 118) and Common Practice (page 131) commands, as well as device specific commands. A Device Specific command is supported without any translation of the data.

# Commands Supported by the Module

The format of each command in the list is independent on the function being executed. All parameters in the command table must be entered. Only one parameter is optional, the Fixed Data field, which contains data to be sent to a HART device. The tables below list the functions supported by the module:

### **HART Universal Commands Set**

Command	Definition			
00	Read Unique Identifier			
01	Read Primary Variable			
02	Read Current And Percent Of Range			
03	Read Dynamic Variables			
06	Write Polling Address			
07	Read Loop Configuration			
08	Read Dynamic Variable Classifications			
09	Read Device Variables with Status			
11	Read Unique Identifier Associated With Tag			
12	Read Message			
13	Read Tag Descriptor Date			
14	Read PV Sensor Info			
15	Read Output Information			
16	Read Final Assembly Number			
17	Write Message			
18	Write Tag Descriptor Date			
19	Write Final Assembly Number			
20	Read Long Tag			
21	Read Unique Identifier Associated With Long Tag			
22	Write Long Tag			

# **HART Common Practice Commands Set**

Command	Definition	
33	Read Transmitter Variables	
34	Write Damping Value	
35	Write Range Values	
36	Set Upper Range Value	
37	Set Lower Range Value	
38	Reset Configuration Changed Flag	
39	EEPROM Control	
40	Enter Exit Fixed Current Mode	
41	Perform Transmitter Self Test	
42	Perform Master Reset	
43	Set PV Zero	
44	Write PV Units	

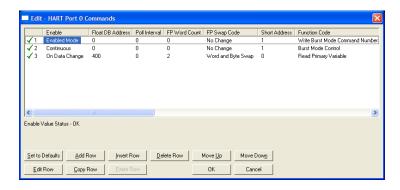

Command	Definition			
45	Trim DAC Zero			
46	Trim DAC Gain			
47	Write Transfer Function			
48	Read Additional Transmitter Status			
49	Write PV Sensor Serial Number			
50	Read Dynamic Variable Assignments			
51	Write Dynamic Variable Assignments			
52	Set Transmitter Variable Zero			
53	Write Transmitter Variable Units			
54	Read Transmitter Variable Information			
55	Write Transmitter Variable Damping Value			
56	Write Transmitter Variable Sensor Serial Number			
57	Read Unit Tag Descriptor Date			
58	Write Unit Tag Descriptor Date			
59	Write Number Of Response Preambles			
60	Read Analog Channel and Percent of Range			
61	Read Dynamic Variables and PV Analog Ch			
62	Read Analog Channels			
63	Read Analog Channel Information			
64	Write Analog Channel Additional Damping Value			
65	Write Analog Channel Range Values			
66	Enter/Exit Fixed Analog Channel Mode			
67	Trim Analog Channel Zero			
68	Trim Analog Channel Gain			
69	Write Analog Channel Transfer Function			
70	Read Analog Channel Endpoint Values			
71	Lock Device			
72	Squawk			
73	Find Device			
74	Read I/O System Capabilities			
75	Poll Sub-Device			
76	Read Lock Device State			
79	Write Device Variable			
80	Read Device Variable Trim Points			
81	Read Device Variable Trim Guidelines			
82	Write Device Variable Trim Point			
83	Reset Device Variable Trim			
105	Read Burst Mode Configuration			
106	Flush Delayed Responses			
107	Write Burst Device Variables			
108	Write Burst Mode Command Number			

Command	Definition
109	Burst Mode Control
110	Read All Dynamic Variables

### **HART Command Entry Formats**

Refer to the Reference (page 39, page 79, page 118) chapter for a complete discussion of the HART commands supported by the module, and the structure and content of the data returned for each command.

The following illustration shows a command list section of the configuration file:

# Enable

0, 1, 2, 3, 4, 5

This field defines whether the command is to be executed and under what conditions.

Code	Description			
0	The command is disabled and will not be executed in the normal polling sequence. This can be used to process a command from a bursting slave device.			
1	Causes the command to be executed each scan of the command list if the Poll Interval Time is set to zero. If the Poll Interval time is set, the command will be executed, when the interval timer expires.			
2	The command will execute only if the internal data associated with the command changes. This value is valid only when there is a specified "Write DB Address" (see below) with a non zero byte count for write commands.			
3	The HART module will send the command if either the MVI56-HART module OR the HART device is powered up. This is mainly used for configuration of HART devices on startup.			
4	Places the command in enabled mode. This option is valid only if there is a specified "Enabled DB Address" (see below). If the Virtual Database word specified in "Enabled DB Address" has "-1" the command will be executed otherwise it will not.			
5	Places the command in one shot enabled mode. This option is valid only if there is a specified "Enabled DB Address" (see below). If the Virtual Database word specified in "Enabled DB Address" has a value of "-1" the command will be executed otherwise it will not. When the command has been successful the Virtual Database word specified in "Enabled DB Address" will be written with "0", so the command will be executed only once.			

Refer to Command Enable Control Block (9902) (page 86) and Command Disable Control Block (9903) (page 87) for more information on how to use the enable code.

### Float DB Address

0 to 3998

This field specifies the internal database register where the floating point values returned by the command will be placed.

#### Poll Interval

#### 0 то 65535

This parameter specifies the minimum interval between executions of a continuous commands (*Enable* code of 1). The value is in seconds. Therefore, if a value of 10 is entered, the command will execute no more frequently than once every 10 seconds.

# FP Word Count

-1 to 125

This parameter specifies the number of words from the floating point data returned by a HART command that will be placed on the Virtual Database. If this parameter is 0 no data will be written to the Database. If this parameter is -1 then all the floating point data will be written in the integer block of data.

Special care should be taken with this number, because is a word count and a floating point value is 2 words long. For example if you execute a HART command 3 which takes 5 floating point values from the device, you should place a word count of 10 words.

# Swap Code

0, 1, 2, 3

This parameter defines the byte order of each four-byte group of data received. This parameter is helpful when dealing with floating-point or other multi-register values, as there is no standard byte order for storing these data types. The following table describes the values and their associated operations:

Swap Code	Description			
0	None - No Change is made in the byte ordering (1234 = 1234)			
1	Words - The words are swapped (1234=3412)			
2	Words & Bytes - The words are swapped then the bytes in each word are swapped (1234=4321)			
3	Bytes - The bytes in each word are swapped (1234=2143)			

#### Short Address

0 = Point-to-Point

1 to 15 = Multi-drop

This parameter specifies the HART slave node address on the network to which the command will be sent. Values of 0, or 1 to 15 are permitted. If the device to be addressed only accepts long address, then the parameter "Use Long" should be selected so the module can ask for the long address with the short one and then execute the command.

### Function Code

0 to 255

This parameter specifies the HART function to be executed. Any HART function can be executed, even device specific ones, but only supported commands will return formatted data and classified in floating point data and integer data.

#### Int. DB Address

0 to 3999

This field specifies the internal database register where the integer or packed ASCII string values returned by the command will be placed.

If the Floating Point Word Count parameter is "-1", then all the data returned by the HART command will be placed in this address without any formatting.

## Int Word Count

0 to 125

This parameter specifies the number of words from the integer or packed ASCII string data returned by a HART command that will be placed on the Virtual Database. If this parameter is "0", no data will be written to the Database.

### Swap Code

0, 1, 2, 3

This parameter defines the byte order of each four-byte group of data received. This parameter is helpful when dealing with floating-point or other multi-register values, as there is no standard byte order for storing these data types. The following table describes the values and their associated operations:

Swap Code	Description		
0	None - No Change is made in the byte ordering (1234 = 1234)		
1	Words - The words are swapped (1234=3412)		
2	Words & Bytes - The words are swapped then the bytes in each word are swapped (1234=4321)		
3	Bytes - The bytes in each word are swapped (1234=2143)		

### Use Long

0 or 1

This parameter defines if the command will be executed with short or long address. If the value is "0", then the configured command will be executed using the Short Address specified. If the value is "1" then the specified Short Address will be used only to ask for the long address and that will be used to execute the configured command.

# Enable DB Address

0 to 3999

This field specifies the internal database register to be used to enable the execution of a command. This parameter is only used if "Enable" is "4" or "5". If the value of this database register is "-1", then the command will be executed, otherwise it will not. If the "Enable" value is "5", then after the successful execution of the command this value will become "0"

#### Done DB Address

-1 to 3999

This field specifies the internal database register to be used to signal the successful execution of a command. When a command is successfully executed a "-1" is written to this register. This "Done DB Address" can be shared with the "Enable DB Address" of another command to do a chained command execution.

### Write DB Address

#### -1 to 7999 Bytes

This field specifies the internal database register to use as a source of data for HART commands that include data. It is possible to include data with every HART command, but only if the command and the device will accept this data.

If this value is "-1", it indicates that there will not be data with the command or that it will not come from the database.

**Note:** This value is specified in Bytes, not Words.

### Swap Code

0, 1, 2, 3

This parameter defines the byte order of each four-byte group of data received. This parameter is helpful when dealing with floating-point or other multi-register values, as there is no standard byte order for storing these data types. The following table describes the values and their associated operations:

Swap Code	Description		
0	None - No Change is made in the byte ordering (1234 = 1234)		
1	Words - The words are swapped (1234=3412)		
2	Words & Bytes - The words are swapped then the bytes in each word are swapped (1234=4321)		
3	Bytes - The bytes in each word are swapped (1234=2143)		

#### Byte Count

0 to 250

This parameter specifies the number of bytes to be sent to a HART device in the command. If the command has no data then this value should be "0".

If the value of this field is different of "0" and "Write DB Address" is different of "-1" then the data for the command will be taken from the Virtual Database. If the value of this field is different of "0" and "Write DB Address" is "-1" then the data for the command will be from the "Fixed Data" field for the command.

# Fixed Data

Up to 250 HEX values separated by space

This parameter is a string of HEX values to be sent with the HART command. There should be at least the number of bytes specified in the "Byte Count" parameter. The bytes should be written in hexadecimal format and separated by a space. This data will be sent if the Parameter "Write DB Address" is "-1" and "Byte Count" is greater than "0", and it will be sent in the same order that they are written.

# 2.3 Hart Command Examples

This section describes two examples that shows how to configure HART commands. The first example shows a read command (function code 3 - READ DYNAMIC VARIABLES) and the second example shows a write command (function 34 - WRITE DAMPING VALUE).

# 2.3.1 Example of HART Command Function 3

The following example shows how to configure a command function 3 (READ DYNAMIC VARIABLES) to read the process variables from the HART slave device. According to the HART specification, this command will return four floating-point variables:

Word	High Byte	Low Byte	
0	Current (mA)		
1			
2	Primary Variable		
3			
4	Second Variable		
5			
6	Third Variable		
7			
8	Fourth Variable		
9			

The command also returns the following integer data:

Word	High Byte	Low Byte	
0	Status Word		
1	Primary Variable Units Code	Second Variable Units Code	
2	Third Variable Units Code	Fourth Variable Units Code	

So, this command will return the following number of words:

Parameter	Data Type	Direction	Number of Words	Database Address (this example)
Variable Results	Floating Point	Read from slave to MVI	10	240 (word address)
Status/Unit Codes	Integer	Read from slave to MVI	3	290 (word address)

The user can configure the command parameters as described in the following table in order to correctly read the command 3 results to the module database:

Index	Parameter	Value	Observation
1	Enable	1	The command is sent continuously
2	Float DB Address	240	The floating point results will be copied to the internal database starting at word-address 240 (from 240 to 249)
3	Poll Interval	0	The command is sent without any delay
4	Word Count	10	The command returns 10 words of floating point data
5	Swap Code	3	The bytes in each returned floating point word are swapped

Index	Parameter	Value	Observation
6	Short Address	0	This command is sent to the Hart slave device using short address 0
7	Function Code	3	The command function 3 (READ DYNAMIC VARIABLES) is used in this example
8	Int. DB Address	290	The integer data will copied to the database starting at word-address 290 (from 290 to 292)
9	Word Count	3	The command returns 3 words of integer data
10	Swap Code	3	The bytes in each returned integer data will be swapped
11	Use Long	1	This command executes using Long Address
12	Enable Address	-1	This command does not use this feature
13	DB Done Address	-1	This command does not use this feature
14	DB Write Address	-1	This parameter is ignored since no data is sent to the HART device (this is a read command)
15	DB Swap Code	3	This parameter is ignored since no data is sent to the HART device (this is a read command)
16	Byte Count	0	This parameter is ignored since no data is sent to the HART device (this is a read command)
17	Fixed Data		This command does not use this feature

So these values could be entered in the configuration file as described below:

START																	
#	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17
#		Float DB	Poll	Word	Swap	Short	Func	Int. DB	Word	Swap	Use	Enable	DB Done	DB Write DE	Swap	Byte F	ixed
#Enab	le	Address	Interval	Count	Code	Address	Code	Address	Count	Code	Long	Address	Address	Address	Code	Count	Data
	1	240	0	10	3	0	3	290	3	3	1	-1	-1	-1	3	0	
END																	

In this example, the user should verify that the command result is located inside the Read Data area, in order to have the data copied to the PLC processor (through the backplane). The following backplane configuration could be used for this example:

Read Register Start: 0 #Starting DB address where read by processor Read Register Count: 300 #Number of regs for processor to read Write Register Start: 300 #Starting DB address where write data placed Write Register Count: 300 #Number of regs to write to module from processor

# 2.3.2 Example of HART Command Function 34

The following example shows how to configure a command function 34 (WRITE DAMPING VALUE) to write a damping values (seconds) to the HART slave device.

According to the HART specification, this command will write one floating point variables:

Word	High Byte	Low Byte	
0	Floating Point Damping Value (Sec)		
1			

The HART device should also return the floating point value after it processes the request:

Word	High Byte	Low Byte	
0	Floating Point Damping Value (Sec)		
1			

The HART device also returns an integer status data:

Word	High Byte	Low Byte	
1	STATUS WORD		

This command will return the following number of words:

Parameter	Data Type	Direction	Number of Words	Database Address (this example)
Damping Value	Floating Point	Written from MVI to slave	2 (4 bytes)	400 (word address) or 800 (byte address)
Damping Value	Floating Point	Read from slave to MVI	2	240 (word address)
Status Word	Integer	Read from slave to MVI	1	290 (word address)

The user can configure the command parameters as described in the following table.

Index	Parameter	Value	Observation
1	Enable	1	The command is sent continuously
2	Float DB Address	300	The damping value response will be copied to the internal database starting at word-address 300 (occupies addresses 300 to 301)
3	Poll Interval	0	The command is sent without any delay
4	Word Count	2	The command returns 10 words of floating point data
5	Swap Code	3	The bytes in each returned floating point word are swapped
6	Short Address	0	This command is sent to the Hart slave device using short address 0
7	Function Code	34	The command function 4 (WRITE DAMPING VALUE) is used in this example
8	Int. DB Address	320	The integer data will copied to the database word-address 320
9	Word Count	1	The command returns 1 word of integer data
10	Swap Code	3	The bytes in each returned integer data will be swapped
11	Use Long	1	This command executes using Long Address

ProSoft Technology, Inc. October 13, 2011

Index	R Parameter			Va	alue		Obs	ervat	ion								
12			Enable -1 -1			This	This command does not use this feature										
13	DB Done Address		-1			This	This command does not use this feature										
14	DB Write Address		g pg p			ıs the da		300									
15	DB Swap Code		3			The swap	•	in ea	ach r	eturned	d intege	r data w	ill be				
16	Byte Count		4			HAR		vice,	since	the da	•	2 words) value us		ting			
17		Fi	xed Dat	а				This	comr	nand	doe	s not u	se this f	eature			
START																	
#	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17
ŧ		Float DB	Poll	Word	Swap	Short	Func	Int. DE	Word	Swap	Use	Enable	DB Done	DB Write	DB Swap	Byte	Fixed
# Enab	le	Address	Interval	Count	Code	Address	Code	Address	Count	Code	Long	Address	Address	Address	Code	Count	Data
END	1	300	0	2	3	0	34	320	) 1	. 3	1	-1	-1	800	3	4	

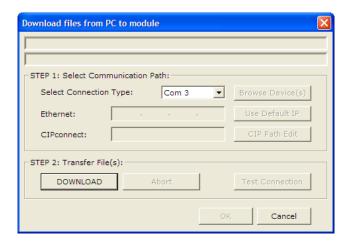

The user would have to verify that addresses 300 and 320 are located inside the Read Data area (read from the MVI database to the PLC processor). Address 400 would have to be located inside the Write Data area (written from the PLC processor to the MVI database).

# 2.4 Downloading the Project to the Module Using a Serial COM Port

For the module to use the settings you configured, you must download (copy) the updated *Project* file from your PC to the module.

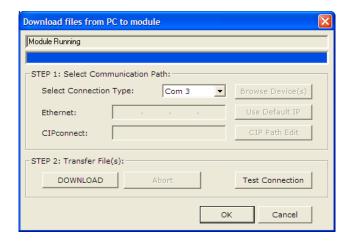

### To download the project file

- 1 In the tree view in *ProSoft Configuration Builder*, click once to select the module.
- 2 Right-click the module icon to open a shortcut menu. From the shortcut menu, choose **DOWNLOAD FROM PC TO DEVICE**. The program will scan your PC for a valid com port (this may take a few seconds). When *PCB* has found a valid COM port, the *Download* dialog box will open.

**3** Choose the COM port to use from the dropdown list, and then click the **DOWNLOAD** button.

The module will perform a platform check to read and load its new settings. When the platform check is complete, the status bar in the *Download* dialog box will display the message *Module Running*.

# 3 Ladder Logic

# In This Chapter

<b>*</b>	Using the Sample Program	52
*	Adding the Module to an Existing Project	57

Ladder logic is required for the MVI56-HART module to work. Tasks that must be handled by the ladder logic are module data transfer, special block handling, and status data receipt. Additionally, a power-up handler may be needed to handle the initialization of the module's data and to clear any processor fault conditions.

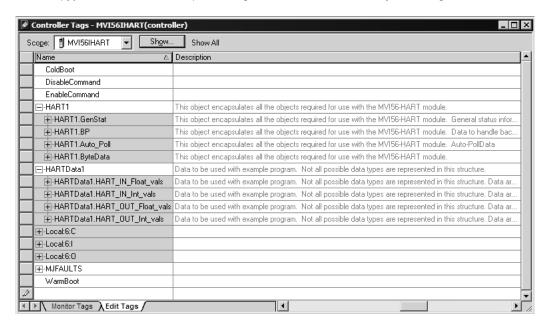

The sample ladder logic, on the *inRAx CD-ROM*, is extensively commented, to provide information on the purpose and function of each rung. For most applications, the sample ladder will work without modification.

# 3.1 Using the Sample Program

The sample program consists of user defined data types, controller tags and ladder rungs that allow communication between the ControlLogix processor, the MVI56-HART module, and the HART network. You can use the sample program as-is, or you can incorporate the data types, controller tags and ladder rungs into an existing program.

# 3.1.1 Controller Tags

The MVI56-HART module is defined in the example as HARTData1 to hold all data related to the database (type HARTData) and HART1 to hold all status data related to the module (type HARTModuleDef). The tag name can be set to any valid tag name desired.

#### 3.1.2 Module Status Data and Variables (HARTModuleDef)

All status and variable data related to the MVI56-HART is stored in a user-defined data type. An instance of the data type is required before the module can be used. This is accomplished by declaring a variable of the data type in the Controller Tags Edit Tags dialog box. The following table describes the structure of this object.

Name	Data Type	Description
GenStat	HARTStat	General status information
BP	HARTBackplane	Data to handle backplane logic
Auto_Poll	HARTAutoPoll[10]	Auto-PollData
ByteData	SINT[60]	

This object contains objects that define variables for the module and status data related to the module. Each of these object types is discussed in the following topics of the document.

# Status Object (HARTStat)

This object stores the status data of the module. The HARTStat object (shown in the following example) is updated each time a read block is received by the processor. Use this data to monitor the state of the module at a "real-time" rate.

Name	Data Type	Description
Scan_Cnt	INT	Program Scan Counter
Product_Name	SINT[4]	Product Code
Rev_Level	SINT[4]	Revision
Op_Sys	SINT[4]	Operating system revision
Run_Number	SINT[4]	Run number
Blk_Rd_Count	INT	Number of block read transfers
Blk_Wr_Count	INT	Number of block write transfers
Blk_Parse_Cnt	INT	Number of blocks parsed by module
Blk_Resv	INT	Reserved
Blk_Cmd	INT	Number of command enable/disable blocks
Blk_Err	INT	Number of block errors
ChStat	HARTCHStat[4]	Channel Status Data

Within the HARTStat objects are objects containing the status information for each application port (HARTCHStat). Refer to Status Data Area and Error Codes for a complete listing of the data stored in this object.

# **Channel Status Object (HARTCHStat)**

The HARTCHStat object holds the status data related to a single HART master port. The following table describes the structure of the object.

Name	Data Type	Description
State	INT	State machine value
Comm_State	INT	Comm port state machine value
Dev_stat	INT	Device bits (OK/Err)
Dev_in_poll	INT	Device bits for poll list
Dev_long	INT	Device bits for long address
Cur_cmd	INT	Current command list index
Cmd_req	INT	Number of command requests issued
Cmd_resp	INT	Number of command responses received
Cfg_Err	INT	Configuration Error Word for channel
CurErr	INT	Current error code for channel
LastErr	INT	Last error for channel

This information is passed to the controller from the module with each normal read block image.

# Configuration/Error Status Flags (Cfg\_Err)

The Cfg\_Err word member of the HARTCHStat reports configuration errors for the respective port. If the module is not functioning as expected, inspect the value presented in this object. If a configuration error exists, the associated bit is set. A value of zero for the bit indicates the configuration value is valid. This does not guarantee that the module is configured correctly for your application. The bits used by this member are shown in the following table.

Bit	Code	Description
0	0x0001	Enabled not set to Y or N
1	0x0002	Enable Handheld not set to Y or N
2	0x0004	Primary Master not set to Y or N
3	0x0008	Invalid Preambles (1 to 50)
4	0x0010	Invalid Short Address Retries (0 to 50)
5	0x0020	Invalid Long Address Retries (0 to 50)
6	0x0040	Invalid Retries After Error (0 to 50)
7	0x0080	Invalid Poll Time After Error (0 to 10000)
8	0x0100	Invalid DB Address Status
9	0x0200	Invalid Command Count
10	0x0400	Memory Error in allocating commands
11	0x0800	Memory Error in allocating command fixed data
12	0x1000	Memory Error in allocating TX/RX buffers
13	0x2000	HART Board not found
14	0x4000	Cannot initialize HART channel
15	0x8000	

# Backplane Object (HARTBackplane)

The HARTBackplane object stores all the variables required for the data transfer operation between the module and the controller. The LastRead data member is used as the handshaking byte to indicate the arrival of new data from the module. The following table describes the structure of the object.

Name	Data Type	Description
LastRead	INT	Index of last read block
LastWrite	INT	Index of last write block
BlockIndex	INT	Computed block offset for data table

The other members of the object are be used in the ladder logic to assist in the data transfer operation.

# 3.1.3 Data Object (HARTData)

The HARTData object is defined in the example ladder logic to demonstrate how the data from a module can be stored in the processor. This object can be used to temporarily store a received data set. In this example, four data areas are set up; two for input data (data received from the module) and two for output data (data to transfer to the module). Within each of these two areas, an area for floating-point data and integer data is defined. The following table describes the structure of the object.

Name	Data Type	Description
HART_IN_Float_vals	REAL[100]	Data area to floating-point data
HART_IN_Int_vals	INT[100]	Data area to hold integer data
HART_OUT_Float_vals	REAL[100]	Data area for output floating-point data
HART OUT Int vals	INT[100]	Data area for output integer data

# 3.1.4 Auto-Poll Data (HARTAutoPoll)

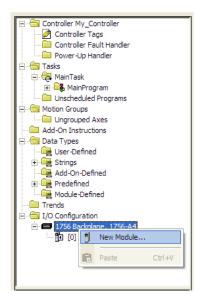

# **Auto-Poll Data (HARTAutoPoll)**

This data object contains the auto-poll data ready to be used by the user (multi-drop or point-to-point). First define where the auto-poll data will copied to in the MVI56-HART database using the DB AutoPoll Address parameter in the configuration file. Then copy the data from the MVI56-HART database into the CLX memory (HARTAutoPoll object) using the ladder logic.

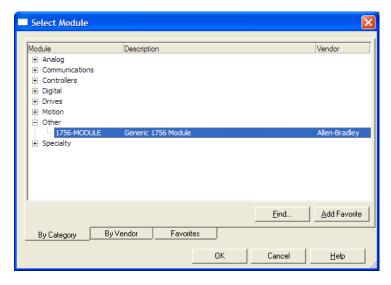

Name	Data Type	Description
Auto_Poll_CMD_Status	SINT	Auto-Polling command status bits
Last_Status_Byte	SINT	Last first status byte received from device
Last_Second_Status_Byte	SINT	Last second status byte received from device
Manufacture_ID_Code	SINT	Device's manufacture ID Code
Device_Type_Code	SINT	Device Type Code
Min_Preambles	SINT	Minimum Number of Preambles
Universal_CMD_Major	SINT	Universal Command Major Rev#
Device_Rev_Level	SINT	Device Revision Level
Software_Rev_Level	SINT	Software Revision Level
Hardware_Rev_Level	SINT	Hardware Revision Level
Device_Flags	SINT	Device Flags
Device_ID	SINT[3]	Device ID
Min_Preambles_Resp	SINT	Minimum Preambles Count to Response
Max_Number_Devices	SINT	Maximum Number of HART Devices in the network
Config_Change_Count	INT	Counter for configuration change
Ext_Dev_Status	SINT	Extended Field Device Status
Primary_Var_Units	SINT	Primary Units Code
Secondary_Var_Units	SINT	Secondary Units Code
Tertiary_Var_Units	SINT	Tertiary Units Code
Quaternary_Var_Units	SINT	Quaternary Units Code
Tag_Name	SINT[8]	HART device Tag Name
Descriptor	SINT[16]	HART device Descriptor
Tag_Descriptor_Data	SINT[3]	HART device descriptor data
Transd_Serial_Num	SINT[3]	Transducer Serial Number
Transd_limits	SINT	Transducer limits
PV_Alarms	SINT	PV Alarm counter
PV_Transfer	SINT	PV Transfer counter
PV_URLLRV_Units	SINT	PV upper and lower range value limits

# 3.2 Adding the Module to an Existing Project

Select the *I/O Configuration* folder in the *Controller Organization* window of RSLogix 5000, and then click the right mouse button to open a shortcut menu. On the shortcut menu, choose **New Module**.

This action opens the Select Module dialog box:

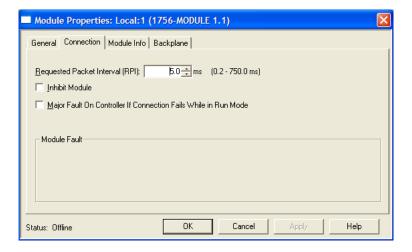

- 2 Select the **1756-Module (Generic 1756 Module)** from the list and click **OK**. This action opens the *New Module* dialog box.
- 3 Enter the *Name, Description* and *Slot* options for your application. You must select the *Comm Format* as **DATA INT** in the dialog box, otherwise the module will not communicate. Click **OK** to continue.

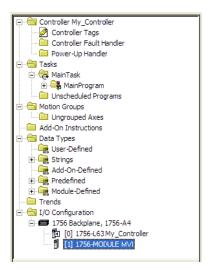

Parameter	Value
Name	Enter a module identification string. Example: HART_2

Parameter	Value
Description	Enter a description for the module. Example: HART MULTI-DROP MASTER COMMUNICATION MODULE
Comm Format	Select DATA-INT.
Slot	Enter the slot number in the rack where the MVI56-HART module is located.
Input Assembly Instance	1
Input Size	250
Output Assembly Instance	2
Output Size	248
Configuration Assembly Instance	4
Configuration Size	0

Select the Requested Packet Interval value for scanning the I/O on the module. This value represents the minimum frequency that the module will handle scheduled events. This value should not be set to less than 1 millisecond. The default value is 5 milliseconds. Values between 1 and 10 milliseconds should work with most applications.

Save the module. Click **OK** to dismiss the dialog box. The *Controller Organization* window now displays the module's presence.

- 6 Copy the *User-Defined Data Types* from the sample program into your existing RSLogix 5000 project.
- 7 Copy the *Controller Tags* from the sample program into your project.
- 8 Copy the Ladder Rungs from the sample program into your project.

# 4 Diagnostics and Troubleshooting

# In This Chapter

*	Reading Status Data from the Module	62
*	LED Status Indicators	.76

The module provides information on diagnostics and troubleshooting in the following forms:

- Status data values are transferred from the module to the processor.
- Data contained in the module can be viewed through the Configuration/Debug port attached to a terminal emulator.
- LED status indicators on the front of the module provide information on the module's status.

# 4.1 Reading Status Data from the Module

The MVI56-HART module returns a status data set to the ControlLogix processor in read blocks with identification codes of 0 and -1. This data is transferred to the ControlLogix processor continuously.

The Configuration/Debug port provides the following functionality:

- Full view of the module's configuration data
- View of the module's status data
- Version Information
- Control over the module (warm boot and cold boot)
- Facility to upload and download the module's configuration file

# 4.1.1 Using ProSoft Configuration Builder (PCB) for Diagnostics

The *Configuration and Debug* menu for this module is arranged as a tree structure, with the *Main* menu at the top of the tree, and one or more sub-menus for each menu command. The first menu you see when you connect to the module is the *Main* menu.

Because this is a text-based menu system, you enter commands by typing the [command letter] from your computer keyboard in the *Diagnostic* window in *ProSoft Configuration Builder (PCB)*. The module does not respond to mouse movements or clicks. The command executes as soon as you press the [COMMAND LETTER] — you do not need to press [ENTER]. When you type a [COMMAND LETTER], a new screen will be displayed in your terminal application.

Using the Diagnostic Window in ProSoft Configuration Builder

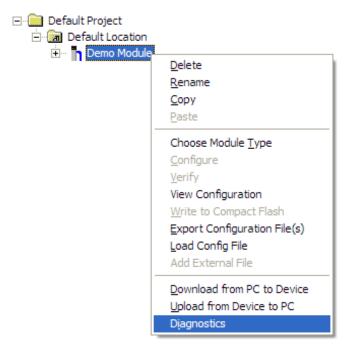

**Tip:** You can have a ProSoft Configuration Builder Diagnostics window open for more than one module at a time.

### To connect to the module's Configuration/Debug serial port

1 Start *PCB*, and then select the module to test. Click the right mouse button to open a shortcut menu.

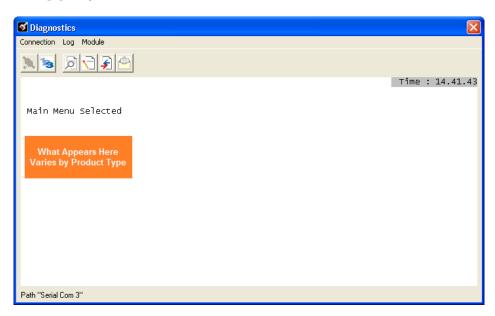

2 On the shortcut menu, choose **DIAGNOSTICS**.

This action opens the *Diagnostics* dialog box.

3 Press [?] to open the *Main* menu.

If there is no response from the module, follow these steps:

1 Click to configure the connection. On the *Connection Setup* dialog box, select a valid com port or other connection type supported by the module.

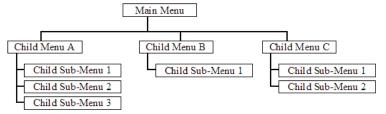

- 2 Verify that the null modem cable is connected properly between your computer's serial port and the module. A regular serial cable will not work.
- 3 On computers with more than one serial port, verify that your communication program is connected to the same port that is connected to the module.

If you are still not able to establish a connection, contact ProSoft Technology for assistance.

#### Navigation

All of the submenus for this module contain commands to redisplay the menu or return to the previous menu. You can always return from a submenu to the next higher menu by pressing **[M]** on your keyboard.

The organization of the menu structure is represented in simplified form in the following illustration:

The remainder of this section shows the menus available for this module, and briefly discusses the commands available to you.

# **Keystrokes**

The keyboard commands on these menus are usually not case sensitive. You can enter most commands in lowercase or uppercase letters.

The menus use a few special characters (?, -, +, @) that must be entered exactly as shown. Some of these characters will require you to use the **SHIFT**, **CTRL**, or **ALT** keys to enter them correctly. For example, on US English keyboards, enter the ? command as **SHIFT** and /.

Also, take care to distinguish the different uses for uppercase letter "eye" ( $\mathbf{I}$ ), lowercase letter "el" ( $\mathbf{L}$ ), and the number one ( $\mathbf{1}$ ). Likewise, uppercase letter "oh" ( $\mathbf{O}$ ) and the number zero ( $\mathbf{0}$ ) are not interchangeable. Although these characters look alike on the screen, they perform different actions on the module and may not be used interchangeably.

### 4.1.2 Main Menu

When you first connect to the module from your computer, your terminal screen will be blank. To activate the main menu, press the [?] key on your computer's keyboard. If the module is connected properly, the following menu will appear.

```
HART COMMUNICATION MODULE MENU
?=Display Menu
B=Block Transfer Statistics
C=Module Configuration
D=Modbus Database View
H=HART Menu
R=Transfer Configuration from PC to MVI Unit
S=Transfer Configuration from MVI Unit to PC
V=Version Information
W=Warm Boot Module
Esc=Exit Program
```

**Caution:** Some of the commands available to you from this menu are designed for advanced debugging and system testing only, and can cause the module to stop communicating with the processor or with other devices, resulting in potential data loss or other communication failures. Use these commands only if you fully understand their potential effects, or if you are specifically directed to do so by ProSoft Technology Technical Support Engineers.

There may be some special command keys that are not listed on the menu but that may activate additional diagnostic or debugging features. If you need these functions, you will be advised how to use them by Technical Support. Please be careful when pressing keys so that you do not accidentally execute an unwanted command.

### Viewing Block Transfer Statistics

Press [B] from the Main menu to view the Block Transfer Statistics screen.

Use this command to display the configuration and statistics of the backplane data transfer operations between the module and the processor. The information on this screen can help determine if there are communication problems between the processor and the module.

**Tip:** To determine the number of blocks transferred each second, mark the numbers displayed at a specific time. Then some seconds later activate the command again. Subtract the previous numbers from the current numbers and divide by the quantity of seconds passed between the two readings.

### Viewing Module Configuration

Press [C] to view the Module Configuration screen.

Use this command to display the current configuration and statistics for the module.

### Opening the Database View Menu

Press [D] to open the Database View menu.

Use this menu command to view the current contents of the module's database. For more information about this submenu, see Database View Menu.

#### Opening the HART Master Menu

Press **[H]** to open the HART Master Menu. This menu allows you to view information about the protocol driver.

```
HART INTERFACE MENU
?=Display Menu
A=HART Data Analyzer
U=Slave Status List
M=Main Menu
HART Command List Errors:
E=Port 0 F=Port 1 G=Port 2 H=Port 3
HART Command List:
N=Port 0 0=Port 1 P=Port 2 Q=Port 3
Port Status and Configuration:
1=Port 0 2=Port 1 3=Port 2 4=Port 3
```

#### Transferring the Configuration File from the PC to the Module

On the Diagnostics Menu this is referred to as Receive Module Configuration.

Press [R] to receive (download) the configuration file from your PC to the module and store the file on the module's Compact Flash Card (Personality Module) or Flash RAM.

Press [Y] to confirm the file transfer, and then follow the instructions on the terminal screen to complete the file transfer process.

After the file has been successfully downloaded, the module will restart the program and load the new configuration information. Review the new configuration using menu commands [6] and [0] to verify that the module is configured correctly.

### Transferring the Configuration File from The Module to the PC

On the Diagnostics Menu this is referred to as Send Module Configuration.

Press [S] to send (upload) the configuration file from the module to your PC.

Press [Y] to confirm the file transfer, and then follow the instructions on the terminal screen to complete the file transfer process.

After the file has been successfully uploaded, you can open and edit the file to change the module's configuration.

#### Viewing Version Information

Press [V] to view version information for the module.

Use this command to view the current version of the software for the module, as well as other important values. You may be asked to provide this information when calling for technical support on the product.

Values at the bottom of the display are important in determining module operation. The *Program Scan Counter* value is incremented each time a module's program cycle is complete.

**Tip:** Repeat this command at one-second intervals to determine the frequency of program execution.

### Warm Booting the Module

Press [W] from the Main menu to warm boot (restart) the module.

This command will cause the program to exit and reload, refreshing configuration parameters that must be set on program initialization. Only use this command if you must force the module to reboot.

#### Exiting the Program

Press **[ESC]** to restart the module and force all drivers to be loaded. The module will use the configuration stored in the module's flash memory to configure the module.

### 4.1.3 HART Master Menu

```
HART INTERFACE MENU

?=Display Menu
A=HART Data Analyzer
U=Slave Status List
M=Main Menu
HART Command List Errors:
E=Port Ø F=Port 1 G=Port 2 H=Port 3
HART Command List:
N=Port Ø 0=Port 1 P=Port 2 Q=Port 3
Port Status and Configuration:
1=Port Ø 2=Port 1 3=Port 2 4=Port 3
```

#### Redisplaying the Menu

Press [?] to display the current menu. Use this command when you are looking at a screen of data, and want to view the menu choices available to you.

#### Opening the Data Analyzer Menu

Press [A] to open the Data Analyzer Menu. Use this command to view all bytes of data transferred on each port. Both the transmitted and received data bytes are displayed. Refer to Data Analyzer (page 70) for more information about this menu.

**Important:** When in analyzer mode, program execution will slow down. Only use this tool during a troubleshooting session. Before disconnecting from the Config/Debug port, please press **[S]** to stop the data analyzer, and then press **[M]** to return to the main menu. This action will allow the module to resume its normal high speed operating mode.

### Viewing the Slave Status List

Press [V] to view the slave status values associated with the ports. The slave status values are defined as follows:

- ERR = Device in Error
- OK = Device OK
- [Blank] = Device Not Polled.

### Opening the Command Error List Menu

Press [E], [F], [G] or [H] to open the Command Error List for clients 1 through 4 respectively. This list consists of multiple pages of command list error/status data. Press [?] to view a list of commands available on this menu.

### Opening the Command List Menu

Press [N], [O], [P] or [Q] to open the Command List menu for clients 1 through 4 respectively. Use this command to view the configured command list for the module.

#### Viewing the Master Command List Help

Press [H] to view a help screen with explanations of each item that appears on the command list.

# Viewing Port Status and Configuration

Press [1], [2], [3], or [4] to view status and configuration for ports 0 through 3 respectively.

# **HART Error Descriptions**

Error Type	Description	
Gap Errors	Increments when a delay of more than 20 milliseconds occurs between characters in a HART message	
Overflow	Increments when a received HART message is longer than the internal buffer can hold	
SOM Errors	<b>Start of Message</b> error - Increments whenever the module does not see at least 3 preambles (FF characters or all bits set ON) at the beginning of a HART message	
Retry Count	Increments every time a HART command fails and is retried	
Check Byte	Increments when a Checksum error is detected in the received HART packet.	
Overrun/Parity/Frame	Increments every time one of three errors occur:	
	Overrun - The HART driver wasn't able to read the current data byte before a new one arrived, causing the current character to be lost.  Parity - HART communications uses EVEN parity. A byte is received with parity error.	
	<b>Frame</b> - There is a zero bit where the stop bit should be. The message is not formatted correctly.	
	These errors are typically caused by electrical wiring problems or electrical interference on the network loop.	
Response Timeout	Increments when the response to a HART Command is not received within the configured timeout period.	

# Returning to the Main Menu

Press [M] to return to the *Main* menu.

# 4.1.4 Data Analyzer

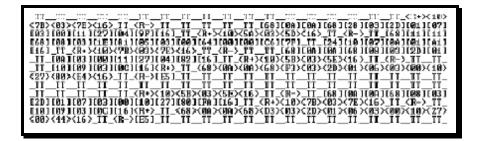

The data analyzer mode allows you to view all bytes of data transferred on each port. Both the transmitted and received data bytes are displayed. Use of this feature is limited without a thorough understanding of the protocol.

```
HART DATA ANALYZER VIEW MENU
?=Display Menu
1=Select HART Port 0
2=Select HART Port 1
3=Select HART Port 2
4=Select HART Port 3
C=1 mSec Ticks
D=5 mSec Ticks
E=10 mSec Ticks
F=50 mSec Ticks
G=100 mSec Ticks
0=No mSec Ticks
0=No mSec Ticks
H=Hex Format
A=ASCII Format
B=Start
S=Stop
Z=HART Menu
Port = HART PORT 0, Format=HEX, Tick=0
```

**Important:** When in analyzer mode, program execution will slow down. Only use this tool during a trouble-shooting session. Before disconnecting from the Config/Debug port, please be sure to press [M] to return to the main menu and disable the data analyzer. This action will allow the module to resume its normal operating mode.

#### Analyzing Data for Port 1

Press [1] to display I/O data for Port 1 in the Data Analyzer. The following illustration shows an example of the Data Analyzer output.

# Displaying Timing Marks in the Data Analyzer

You can display timing marks for a variety of intervals in the data analyzer screen. These timing marks can help you determine communication-timing characteristics.

Key	Interval
[5]	1 milliseconds ticks
[6]	5 milliseconds ticks
[7]	10 milliseconds ticks
[8]	50 milliseconds ticks
[9]	100 milliseconds ticks
[0]	Turn off timing marks

# Removing Timing Marks in the Data Analyzer

Press [0] to turn off timing marks in the Data Analyzer screen.

### Viewing Data in Hexadecimal Format

Press **[H]** from the *Database View* menu to display the data on the current page in hexadecimal format.

# Viewing Data in ASCII (Text) Format

Press [A] from the *Database View* menu to display the data on the current page in ASCII format. This is useful for regions of the database that contain ASCII data.

#### Starting the Data Analyzer

Press [B] to start the data analyzer. After the key is pressed, all data transmitted and received on the currently selected port will be displayed. The following illustration shows an example.

```
\( \text{R+} \cdot \cdot
```

The Data Analyzer displays the following special characters:

Character	Definition
[]	Data enclosed in these characters represent data received on the port.
<>	Data enclosed in these characters represent data transmitted on the port.
<r+></r+>	These characters are inserted when the RTS line is driven high on the port.
<r-></r->	These characters are inserted when the RTS line is dropped low on the port.
<cs></cs>	These characters are displayed when the CTS line is recognized high.
_TT_	These characters are displayed when the timing mark interval has been reached. This parameter is user defined.

#### Stopping the Data Analyzer

Press [S] to stop the data analyzer. Use this option to freeze the display so the data can be analyzed. To restart the analyzer, press [B].

**Important:** When in analyzer mode, program execution will slow down. Only use this tool during a troubleshooting session. Before disconnecting from the Config/Debug port, please press **[S]** to stop the data analyzer, and then press **[M]** to return to the main menu. This action will allow the module to resume its normal high speed operating mode.

#### Returning to the Main Menu

Press [M] to return to the *Main* menu.

# 4.1.5 Data Analyzer Tips

From the main menu, press [A] for the "Data Analyzer". You should see the following text appear on the screen:

Data Analyzer Mode Selected

After the "Data Analyzer" mode has been selected, press [?] to view the Data Analyzer menu. You will see the following menu:

```
DATA ANALYZER VIEW MENU
?=Display Menu
1=Select Port 1
2=Select Port 2
5=1 mSec Ticks
6=5 mSec Ticks
7=10 mSec Ticks
8=50 mSec Ticks
9=100 mSec Ticks
0=No mSec Ticks
H=Hex Format
A=ASCII Format
B=Start
S=Stop
M=Main Menu
Port = 1, Format=HEX, Tick=10
```

From this menu, you can select the "Port", the "format", and the "ticks" that you can display the data in.

For most applications, HEX is the best format to view the data, and this does include ASCII based messages (because some characters will not display on HyperTerminal and by capturing the data in HEX, we can figure out what the corresponding ASCII characters are supposed to be).

The Tick value is a timing mark. The module will print a \_TT for every xx milliseconds of no data on the line. Usually 10milliseconds is the best value to start with.

After you have selected the Port, Format, and Tick, we are now ready to start a capture of this data. The easiest way to do so is to go up to the top of you HyperTerminal window, and do a **Transfer** / **Capture Text** as shown below:

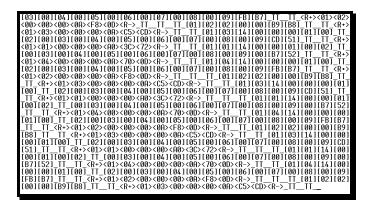

After selecting the above option, the following window will appear:

Next name the file, and select a directory to store the file in. In this example, we are creating a file ProSoft.txt and storing this file on our root C: drive. After you have done this, press the start button.

Now you have everything that shows up on the HyperTerminal screen being logged to a file called ProSoft.txt. This is the file that you will then be able to email to ProSoft Technical Support to assist with issues on the communications network.

To begin the display of the communications data, you will then want to press **[B]** to tell the module to start printing the communications traffic out on the debug port of the module. After you have pressed **[B]**, you should see something like the following:

The <R+> means that the module is transitioning the communications line to a transmit state.

All characters shown in <> brackets are characters being sent out by the module.

The <R-> shows when the module is done transmitting data, and is now ready to receive information back.

And finally, all characters shown in the [] brackets is information being received from another device by the module.

After taking a minute or two of traffic capture, you will now want to stop the "Data Analyzer". To do so, press the [S] key, and you will then see the scrolling of the data stop.

When you have captured the data you want to save, open the Transfer menu and choose Capture Text. On the secondary menu, choose Stop.

You have now captured, and saved the file to your PC. This file can now be used in analyzing the communications traffic on the line, and assist in determining communication errors.

#### 4.1.6 Master Command Error List Menu

Use this menu to view the command error list for the module. Press [?] to view a list of commands available on this menu.

## Redisplaying the Current Page

Press [S] to display the current page of data.

## Moving Back Through 5 Pages of Commands

Press [-] to display data for last 5 page commands.

## Viewing the Previous Page of Commands

Press [P] to display the previous page of commands.

#### Moving Forward (Skipping) Through 5 Pages of Commands

Press [+] to display data for the next page of commands.

## Viewing the Next Page of Commands

Press [N] to display the next page of commands.

## Returning to the Main Menu

Press [M] to return to the Main menu.

#### 4.1.7 Master Command List Menu

Use this menu to view the command list for the module. Press [?] to view a list of commands available on this menu.

## Redisplaying the Current Page

Press [S] to display the current page of data.

#### Viewing the Previous 50 Commands

Press [-] to view the previous 50 commands.

## Viewing the Previous Page of Commands

Press [P] to display the previous page of commands.

## Viewing the Next 50 Commands

Press [+] to view the next 50 commands from the Master command list.

## Viewing the Next Page of Commands

Press [N] to display the next page of commands.

## Returning to the Main Menu

Press [M] to return to the Main menu.

## 4.2 LED Status Indicators

The LEDs indicate the module's operating status as follows:

LED	Color	Status	Indication
CFG	Green	On	NA
		Off	NA
P1	Green	On	NA
		Off	NA
P2	Green	On	Data is being transferred between the module and a remote terminal using the Configuration/Debug port.
		Off	No data is being transferred on the Configuration/Debug port.
APP	Amber	Off	The MVI56-HART is working normally.
Status		On	The MVI56-HART module program has recognized a communication error.
BP ACT Amber On		On	The LED is on when the module is performing a write operation on the backplane.
		Off	The LED is off when the module is performing a read operation on the backplane. Under normal operation, the LED should blink rapidly on and off.
OK	Red/ Green	Off	The card is not receiving any power and is not securely plugged into the rack.
		Green	The module is operating normally.
		Red	The program has detected an error or is being configured. If the LED remains red for over 10 seconds, the program has probably halted. Remove the card from the rack and re-insert the card to restart the module's program.
BAT	Red	Off	The battery voltage is OK and functioning.
		On	The battery voltage is low or battery is not present. Allow battery to charge by keeping module plugged into rack for 24 hours. If BAT LED still does not go off, contact ProSoft Technology, as this is not a user serviceable item.

## 4.2.1 Clearing a Fault Condition

Typically, if the OK LED on the front of the module turns RED for more than ten seconds, a hardware problem has been detected in the module or the program has exited.

To clear the condition, follow these steps:

- 1 Turn off power to the rack.
- 2 Remove the card from the rack.
- 3 Verify that all jumpers are set correctly.
- 4 If the module requires a Compact Flash card, verify that the card is installed correctly.
- 5 Re-insert the card in the rack and turn the power back on.
- Werify correct configuration data is being transferred to the module from the ControlLogix controller.

If the module's OK LED does not turn GREEN, verify that the module is inserted completely into the rack. If this does not cure the problem, contact ProSoft Technology Technical Support.

# 4.2.2 Troubleshooting

Use the following troubleshooting steps if you encounter problems when the module is powered up. If these steps do not resolve your problem, please contact ProSoft Technology Technical Support.

## **Processor Errors**

Problem description	Steps to take	
Processor fault	Verify that the module is plugged into the slot that has been configured for the module in the I/O Configuration of RSLogix.	
	Verify that the slot location in the rack has been configured correctly in the ladder logic.	
Processor I/O LED flashes	This indicates a problem with backplane communications. A problem could exist between the processor and any installed I/O module, not just the MVI56-HART. Verify that all modules in the rack are correctly configured in the ladder logic.	

## **Module Errors**

Problem description	Steps to take	
BP ACT LED (not present on MVI56E modules) remains OFF or blinks slowly MVI56E modules with scrolling LED display: <backplane status=""> condition reads ERR</backplane>	This indicates that backplane transfer operations are failing. Connect to the module's Configuration/Debug port to check this.  To establish backplane communications, verify the following items:  The processor is in RUN or REM RUN mode.  The backplane driver is loaded in the module.  The module is configured for read and write data block transfer.  The ladder logic handles all read and write block situations.  The module is properly configured in the processor I/O configuration and ladder logic.	
OK LED remains RED	The program has halted or a critical error has occurred. Connect to the Configuration/Debug port to see if the module is running. If the program has halted, turn off power to the rack, remove the card from the rack and re-insert it, and then restore power to the rack.

## 5.1 Product Specifications

The MVI56 HART Multi-drop Master Communication Module is designed to allow ControlLogix processors to interface easily with HART compatible devices. Devices commonly supporting the protocol include pressure, temperature, flow transmitters, as well as other similar instruments commonly found in the process (and other) industry.

The MVI56-HART Master Communication Module allows Rockwell Automation ControlLogix compatible processors to easily communicate with HART slave devices. The MVI56-HART module interfaces up to 15 devices on each HART channel with the processor. HART channels on the module support Master protocol commands to interface with slave devices on their own networks. Each port is individually configurable. Data is exchanged between the HART network and the ControlLogix processor backplane using the internal database contained in the module and direct control by the processor's ladder logic and pre-defined data objects (5000 registers maximum).

The MVI56-HART module is the perfect solution for industrial applications in chemical and refining operations, gas and liquid distribution systems, and remote offshore monitoring stations, addressing virtually all aspects of control, data acquisition, and maintenance.

HART® is a registered trademark of the HART Communication Foundation.

## 5.1.1 General Specifications

- Single Slot 1756 backplane compatible
- The module is recognized as an Input/Output module and has access to processor memory for data transfer between processor and module.
- Ladder Logic is used for data transfer between module and processor. Sample ladder file included.
- Configuration data obtained from configuration text file downloaded to module.
   Sample configuration file included
- Local or remote rack

# 5.1.2 Hardware Specifications

Specification	Description
Backplane Current Load	800 mA @ 5 V DC 3mA @ 24V DC
Operating Temperature	0 to 60 °C (32 to 140 °F)
Storage Temperature	-40 to 85℃ (-40 to 185℉)
Shock	30g Operational 50g non-operational Vibration: 5 g from 10 to 150 Hz
Relative Humidity	5% to 95% (non-condensing)
LED Indicators	Module Status Backplane Transfer Status Application Status Serial Activity
Debug/Configuration port (CF	FG)
CFG Port (CFG)	RJ45 (DB-9M with supplied cable) RS-232 only No hardware handshaking
Configuration Connector	RJ45 RS-232 Connector (RJ45 to DB-9 cable shipped with unit)
Application Ports	
AppPort	HART terminal connector

## 5.1.3 Functional Specifications

The MVI56-HART module supports the HART Multi-drop implementation of the protocol. Following are some general specifications for the module:

- Built in accordance to the HART Bell 202 Frequency Shift Keying (FSK) standard to superimpose digital signals at a low level on top of the 4 to 20mA
  - o Four independent HART master ports that are completely user-configurable
  - Supports up to 15 devices per port
  - Point-to-point (slave address 0) or Multi-drop (slave address 1 to 15) modes supported
- Supports 99 universal and common practice commands per port to control and monitor devices with integer, IEEE754 floating-point and packed ASCII character string data blocks
- Burst mode can be used for faster update of data from a single slave
- Supports an auto polling feature that will automatically collect data from each HART instrument on the channel and store the data in the module database
- Communication ports can be configured as a secondary master (that is, handheld configuration device)

**Protocol Supported:** HART protocol uses the Bell 202 standard frequency shift-keying (FSK) digital signal to communicate at 1200 baud, superimposed at a low level on the 4 to 20mA analog measurement signal. The MVI56-HART module supports version 5 of the HART protocol.

**Supported Function Codes**: HART Universal Commands Set supported are 00 to 03, 06 to 09, and 11 to 22. HART Common Practice Commands Set supported are 33 to 83 and 105 to 110.

**HART Network Communications**: Supports four master channels. Each channel on the module is configured independently to emulate a HART master. Burst mode can be used for faster update of data from a slave device.

Command polling is also user-configurable, including disabled, continuous, on change of data (write only), and dynamically user or automatic enabled.

**Status:** Error codes returned by the HART protocol available on an individual command basis. In addition, a slave status list is maintained per active channel.

#### 5.2 Functional Overview

## 5.2.1 General Concepts

The following discussion explains several concepts that are important for understanding the operation of the MVI56-HART module.

## Module Power Up

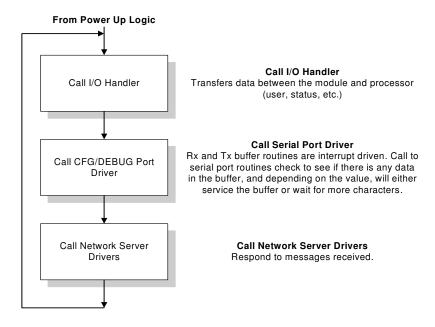

On power up the module begins performing the following logical functions:

- Initialize hardware components
  - Initialize ControlLogix backplane driver
  - Test and Clear all RAM
  - o Initialize the serial communication ports
- Read module configuration from the Compact Flash
- Initialize Module Register space
- Set up the communication interface for the debug/configuration port

When this initialization procedure is complete, the module will begin communicating with other nodes on the network, depending on the configuration.

## Main Logic Loop

Upon completing the power up configuration process, the module enters an infinite loop that performs the functions shown in the following diagram.

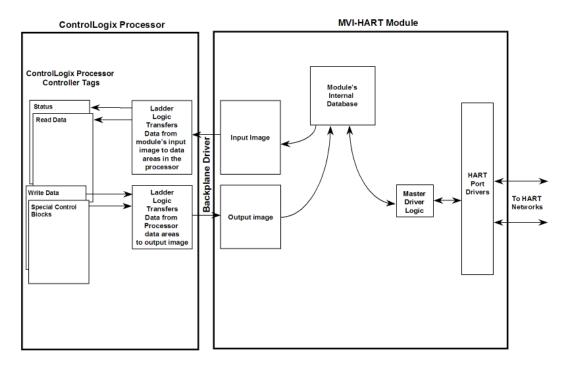

## 5.2.2 Backplane Data Transfer

The MVI56-HART module communicates directly over the ControlLogix backplane. Data travels between the module and the ControlLogix processor across the backplane using the module's input and output images. The update frequency of the data is determined by the scan rate defined by the user for the module and the communication load on the module. Typical updates are in the range of 1 to 10 milliseconds.

Data received by the master drivers is placed in the module's input image. This data is processed by the ladder logic in the ControlLogix processor. The input image for the module is set to 500 bytes. This large data area permits fast throughput of data between the module and the processor.

The processor inserts data in the module's output image to transfer to the module. The module's program extracts the data and transmits the data out to the master driver to the serial network. Additionally, the ControlLogix processor can send special control blocks to the module to instruct it to perform a special task. The output image for the module is set to 496 bytes. This large data area permits fast throughput of data from the processor to the module.

The following illustration shows the data transfer method used to move data between the ControlLogix processor, the MVI56-HART module, and the HART networks.

All data transferred between the module and the processor over the backplane is through the input and output images. Ladder logic must be written in the ControlLogix processor to interface the input and output image data defined in the controller tags. The user is responsible for handling and interpreting all data received on the application ports and transferred to the input image.

As blocks are transferred between the module and the processor, each block contains block identification codes that define the content or function of the block of data transferred.

Block Range	Descriptions
-1	Null block (Status Data Only)
0	Null block (Status Data Only)
1 to 20	Read or write data
9902	Command Enable Control Block
9903	Command Disable Control Block
9950	Command List Error data
9998	Warm Boot Request from PLC (Block contains no data)
9999	Cold Boot Request from PLC (Block contains no data)

Blocks -1 and 0 transfer status data from the module to the processor and they contain no data when transferred from the processor to the module. Blocks 1 to 20 are utilized to transfer data stored or to be stored in the module's database. These data blocks send data from module to the processor (monitored data received from the devices on the HART network) and to send data from the processor to the module (control data to send to the end devices). Block identification codes 9900 to 9999 are used for special control blocks to control the module.

## 5.2.3 Normal Data Transfer

Normal data transfer includes the transferring of data received by, or to be transmitted to, the master drivers and the status data. These data are transferred through read (input image) and write (output image) blocks. Refer to Module Configuration for a description of the data objects used with the blocks and the ladder logic required. The following topics discuss the structure and function of each block.

#### Read Block

These blocks of data transfer information from the module to the ControlLogix processor. The structure of the input image used to transfer data received from the HART devices is shown in the following table.

Offset	Description	Length
0	Reserved	1
1	Write Block ID	1
2 to 201	Read Data	200
202 to 248	Spare	47
249	Read Block ID	1

The Block Identification Code (word 249) signals the ControlLogix processor that a new block is ready for processing and informs the processor of the contents of the block. If the value of the code is set to 1, the block contains the first 200 words of data contained in the database of the module.

If the Read Block ID is set to 0 or -1, the block contains the status data that should be copied to the status data area in the module. This information can be used to determine the "health" and activity of the module. Refer to Status Data Area and Error Codes for a detailed listing of the area and its contents.

The normal read data block also contains the block identification code the module expects to receive from the processor (word 1 in the block). Under normal data transfer conditions, the ladder logic should use the code to build the appropriate block for the module in the output image.

## Write Block

These blocks of data transfer information from the ControlLogix processor to the module. The following table describes the structure of the output image.

Offset	Description	Length
0	Write Block ID	1
1 to 200	Write Data	200
201 to 247	Spare	47

The Block Identification code defines the content of the data contained in the block. If the code is set to -1 or 0, the data area contains no valid data. If the word contains a value from 1 to 20, the data contained in the block should be placed in the appropriate position of the module's database. Under normal conditions, the value used for the write block identification code should be that received in the read block from the module.

#### 5.2.4 Command Control Blocks

Block identification codes greater than 9900 are utilized to perform special functions in the module. Each control block recognized and used by the module is defined in the following topics.

## Block 9902: Command Control

The block 9902 identification code is used by the processor to enable a set of commands that have their enable code set to 4 or 5 (one shot). The value referenced by the address associated with the command, Enable DB Address, will be set to -1 to enable the command for a one-shot (enable code 5) or continuous (enable code 4) execution. After the command is executed, the module resets the register to 0 to disable the command for the one-shot mode. The format for this command block is shown in the following table.

Word Offset in Block	Data Field(s)	Description
0	Block ID	This field contains the value of 9902 identifying the enable command to the module.
1	Port Number	This is the HART port number (0 to 3) for the command. Each port has its own command list.
2	Command count	This field contains the number of commands To enable in the command list. Valid values for this field are 1 to 60.
3 to 62	Command Numbers to enable	These 60 words of data contain the command numbers in the command list to enable. The value referenced by the Enable DB address associated with each command will be set to -1.
63 to 247	Spare	Not Used

There is no response to this block by the module.

## Block 9903: Command Disable Control Block

The block 9903 identification code is used by the processor to disable a set of commands that have an enable code set to 4 or 5 (one shot). The value referenced by the address associated with the command, Enable DB Address, will be set to 0 to disable the command. The format for this command block is shown in the following table.

Word Offset in Block	Data Field(s)	Description
0	Block ID	This field contains the value of 9903 identifying the enable command to the module.
1	Port Number	This is the HART port number (0 to 3) for the command. Each port has its own command list.
2	Command count	This field contains the number of commands to disable in the command list. Valid values for this field are 1 to 60.
3 to 62	Command Numbers to enable	These 60 words of data contain the command numbers in the command list to disable. The value referenced by the Enable DB address associated with each command will be set to 0.
63 to 247	Spare	Not Used

There is no response to this block by the module.

## Block 9950: Read Command Error List

Block 9950 identification code requests the Command List Error Table for a single port from the module for the 100 user configurable commands. The following table describes the format of this block.

Word Offset in Block	Data Field(s)	Description
0	Block ID	This field contains the value of 9950 identifying the block type to the module.
1	Port Number	This field contains the port number to report in the response block. Valid values are 0 to 3 for ports 0 to 3 on the module.
2	Number of Commands to report	This field contains the number of commands to report in the response message. The value has a range of 1 to 100.
3	Start Index of First Command	This parameter sets the index in the command list where to start. The first command in the list has a value of 0. The last index in the list has a value of MaxCommands - 1.
4 to 247	Spare	Not Used

The module responds to a valid request with a block containing the requested error information. The following table describes the format of this block.

Word Offset in Block	Data Field(s)	Description
0	Reserved	Reserved (0)
1	Block ID	This is the next block requested by the module.
2	Port Number	This field contains the port number (0 to 3) corresponding to the data contained in the block.
3	Number of Commands reported	This field contains the number of commands contained in the block that must be processed by the PLC. This field will have a value of 1 to 100.

Word Offset in Block	Data Field(s)	Description
4	Start Index of First Command	This field contains the index in the command list for the first value in the file. This field will have a value of 0 to MaxCommands-1.
5 to 104	Command List Errors	Each word of this area contains the last error value recorded for the command. The command index of the first value (offset 4) is specified in word 3 of the request block. The number of valid command errors in the block is set in word 3 of the block. Refer to the command error list to interpret the error codes reported.
105 to 248	Spare	Not Used
249	Block ID	This field contains the value of 9950 identifying the block type to the PLC.

For further information concerning the status blocks (0 and -1) please refer to Status Data.

## Block 9998: Warm Boot

Block 9998 performs a warm-boot operation on the module. The following table describes the format of the block constructed by the processor.

Offset	Description	Length
0	9998	1
1 to 247	Spare	247

## Block 9999: Cold Boot

Block 9999 performs a cold-boot operation on the module. The following table describes the format of the block constructed by the processor.

Offset	Description	Length
0	9999	1
1 to 247	Spare	247

#### 5.2.5 HART Channels

The MVI56-HART module supports the HART protocol as a Master on up to four channels. Each channel is individually configurable.

The HART protocol uses the Bell 202 standard frequency shift-keying (FSK) signal to communicate at 1200 baud, superimposed at a low level on the 4 to 20 mA analog measurement signal. Having an average value of zero, and FSK signal causes no interference with the analog value. The HART devices are powered from this 4 to 20 mA analog loop.

Both HART protocol channels in the module generate the Bell 202 FSK signal to communicate in multi-drop mode with up to 15 HART devices and provide up to 250 mA supply for analog loop.

## Auto-Poll Modes

Each HART channel can be set to operate in three different modes:

- Point-to-Point
- Multi-drop
- User Mode

Using the configuration file, choose the auto-poll mode through the Auto-Poll Code parameter (P, M, or N). In the first two modes, the module will automatically collect data from each HART instrument on the channel (auto-poll) and store the data in the module's database.

In User Mode, the module will only execute the commands in the user command list and will not automatically acquire data. Refer to the Auto-Polling section for more information.

Mode	Use Auto-Poll	Use Command List
N (None)	N	Υ
M (Multi-drop)	Υ	Υ
P (Point-to-Point)	Υ	Υ

When configured for Point-to-Point communication, the channel will automatically poll data from the connected slave address 0.

When configured for Multi-drop, the channel will automatically poll data from the connected slaves in the network (address 1 to 15). Refer to the Auto-Polling section for more information about auto-poll mode.

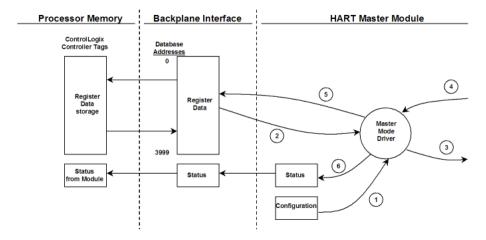

User-configured commands can be issued on each channel to the HART devices. Up to 99 commands can be defined for each port. Data read from the devices is placed in the virtual database of the module, which is passed between the module and the processor.

Any write requests or device-specific commands for the HART slave devices are sourced with data from the virtual database, or from a configured constant data block. Within the commands, it can be specified whether or not to use the HART device's short or long address. If the long address is selected, the device is polled first with short address to ask for the long one. Then, the device is polled with the long address. The module does this processing automatically.

In a HART network, it is possible to have two masters. The module fully supports the existence of a second master, but it can reduce the throughput on the HART network. This facility is enabled or disabled in the module's configuration. If the ability to have a second master on the network is disabled, then the maximum communication throughput is achieved.

## 5.2.6 Master Driver

The master driver supported on each application port of the module emulates a HART master device. Configuration of each port is independent and should be connected to different HART networks. Up to 15 devices can be connected to each channel. Control of the slave devices by the master port is using a user-constructed command list autopolling, if enabled. Data for these commands is sourced from the module's database. Data read from the slave devices is placed in the module's database. The following diagram shows the operation of the master driver:

- 1 The master driver is configured as specified by the HART.CFG file
- 2 The master will construct control commands using the data in the database
- 3 The master will send these commands and read requests out on the network
- 4 Response messages generated by controlled devices on the network are received by the master driver
- 5 Read data received by the master is passed to the module's database and passed to the processor
- 6 Additionally, status data for the module is passed to the processor

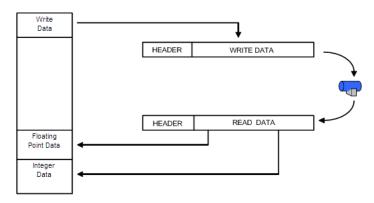

#### HART Command List

The HART Command List specifies the commands to be executed to the HART devices connected to a channel. A HART command can be seen as an outgoing message to the HART devices that provides Write Data for a specific command or a response message that carries process data (Read Data) back to the module. The MVI56 module supports three kinds of data blocks in the Universal and Common Practice commands. These data blocks are:

- Integers
- IEEE 754 Floating Point Numbers (32 bits)
- Packed ASCII character strings

The Packed ASCII character strings are unpacked and placed with the integers data block.

For all commands, it is possible to select where the Write Data comes from; it can be in the module's internal database or it can be configured as a fixed data block in the command. For response messages from HART devices, it is possible to configure where the Floating Point Data and Integer Data will be placed in the module's internal database, but this is only possible for the Universal and Common Practice commands. In the case of Device Specific commands, all the Read Data is placed in the Integer data section. See HART Command Support for a listing of supported HART commands.

#### **Burst Mode**

If a slave on a network will be placed in burst mode, its data can be placed in the module's database. For the command to be burst by slave device, enter a command in the user command list with the appropriate HART command number. Set the type field to 0 to disable the command. The parameters in the command will be used to store the data received from the bursting slave. There can only be one slave bursting on the network at any one time. This mode can be used for faster update of data from a slave.

#### Auto-Polling

This feature is enabled by setting the AUTO-POLL CODE (in the configuration file) to a value of P (point-to-point). If the value N is entered for the parameter, the auto-poll feature is disabled. When the feature is disabled, the channel will only execute the commands enabled in the user command list. When the auto-polling mode is enabled, the module will automatically acquire data from the HART instruments attached to a channel without the use of user commands. If user commands are present and enabled when the feature is enabled, they will also be executed independent of auto-polling.

With the auto-poll feature enabled, the module automatically generates the following HART commands and stores the data in the module's database at the user-specified location:

CMD	Description
0	Read Unique Identifier
3	Read Current and Four Dynamic Variables
13	Read Tag, Descriptor and Date
14	Read PV Sensor Information
15	Read Output Information

If the unit is set for point-to-point mode, the module will automatically gather the information for the device with the polling address (short address) of zero and place the data into the database. Each device requires a 50-word database area with the format shown in the following table.

DB Byte Offset	Туре	Description	Byte Cnt	Data Source	Use of Data
0	byte	Auto-polling command status bits	1	Арр	Status
1	byte	Last first status byte received from device	1	Resp	Status
2	byte	Last second status byte received from device	1	Resp	Status
3	byte	Manufacture ID Code	1	CMD 0	LongAddress
4	byte	Device Type Code	1	CMD 0	LongAddress
5	byte	Minimum number of preambles	1	CMD 0	Msgconstruction
6	byte	Universal Command Major Rev #	1	CMD 0	Msgchoice
7	byte	Device Revision Level	1	CMD 0	Info
8	byte	Software Revision Level	1	CMD 0	Info
9	byte	Hardware Revision Level/Physical Signaling Code	1	CMD 0	Info
10	byte	Device Flags	1	CMD 0	Info
11 to 13	byte	Device ID	3	CMD 0	Long Address
14	byte	Minimum number of preambles to be sent with the response message from the slave to the master.	1	CMD 0	
15	byte	Maximum number of device variables	1	CMD 0	Info
16 to 17	word	Configuration Change Counter	2	CMD 0	Info
18	byte	Extended Field Device Status	1	CMD 0	Info
19	byte	Primary variable units code	1	CMD 3	Cfg
20	byte	Secondary variable units code	1	CMD 3	Cfg
21	byte	Tertiary variable units code	1	CMD 3	Cfg
22	byte	Quaternary variable units code	1	CMD 3	Cfg
23 to 30	byte	Tag name	8	CMD 13	Info
31 to 46	byte	Descriptor	16	CMD 13	Info
47 to 49	byte	Tag/Descriptor data	3	CMD 13	Info
50 to 52	byte	Transducer serial number	3	CMD 14	Info
53	byte	Transducer limits and min span units code	1	CMD 14	Info
54	byte	PV alarm selection code	1	CMD 15	Info
55	byte	PV transfer function code	1	CMD 15	Info
56	byte	PV upper and lower range value units code	1	CMD 15	Info
57	byte	Write protection code	1	CMD 15	Status
58	byte	Private label distributor code	1	CMD 15	Info
59	byte	PV analogchannel flag	1	CMD 15	Info
		TOTAL BYTE COUNT	60		
		TOTAL WORD COUNT	30	_	

DB Byte Offset	Туре	Description	Byte Cnt	Data Source	Use of Data
60 to 63	float	Primary variable value	4	CMD 3	Status
64 to 67	float	Secondary variable value	4	CMD 3	Status
68 to 71	float	Tertiary variable value	4	CMD 3	Status
72 to 75	float	Quaternary variable value	4	CMD 3	Status
76 to 79	float	Upper transducer limit	4	CMD 14	Cfg
80 to 83	float	Lower transducer limit	4	CMD 14	Cfg
84 to 87	float	Minimum span	4	CMD 14	Cfg
88 to 91	float	PV upper range value	4	CMD 15	Cfg
92 to 95	float	PV lower range value	4	CMD 15	Cfg
96 to 99	float	PV damping value (in seconds)	4	CMD 15	Cfg
		TOTAL FLOAT BYTE COUNT	40		
		TOTAL FLOAT WORD COUNT	20	_	

DB Regs/Device	50
Max DB Regs/channel for 15 Devices	750
Max DB Regs for HART Card	3000

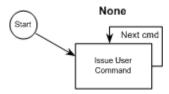

The following table defines the auto-polling command status bits:

Bit #	Description
0	Long Address Set (command 0 successful)
1	Command 13 successful (configuration)
2	Command 14 successful (configuration)
3	Command 15 successful (configuration)
4	Command 3 successful (data polling)
5	Reserved
6	Reserved
7	Reserved

The following topics describe the modes of module operation.

## **Auto-Poll Disabled Mode**

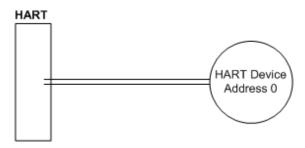

If the auto-polling feature is disabled (Auto-Poll Code = N), the module functions as shown in the following diagram:

Only the user commands are executed and all data is placed in and sourced from the module's internal database. The user is responsible for constructing all commands to control and monitor the instruments attached to the channel.

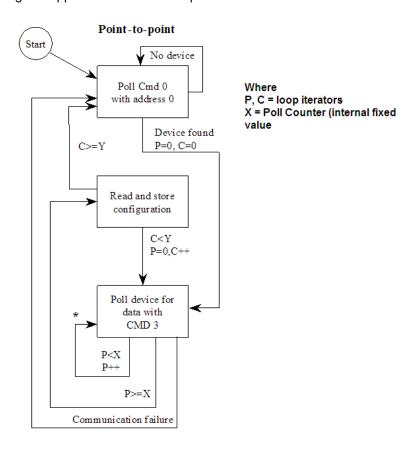

## **Point-to-Point Mode**

**Important:** If the HART device address is 0 you must configure the channel for Point-to-Point mode.

In point-to-point mode, the module only polls for a single instrument with a polling address of zero. When the instrument is found by the channel, it continuously polls for the data using command 3. Occasionally, it will poll for the configuration information for the device. This is accomplished with HART commands 13, 14 and 15. Less frequently, the channel will perform a HART command 0 request to see if any of the data for the instrument has changed. If communications is lost with the device, the module will try to establish communications with the device using command 0. If user commands are present and enabled, they will be executed after each data poll.

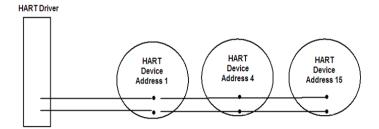

When the point-to-point mode of auto-polling is enabled (Auto-Poll Code = P), the following diagram applies to the channel operation:

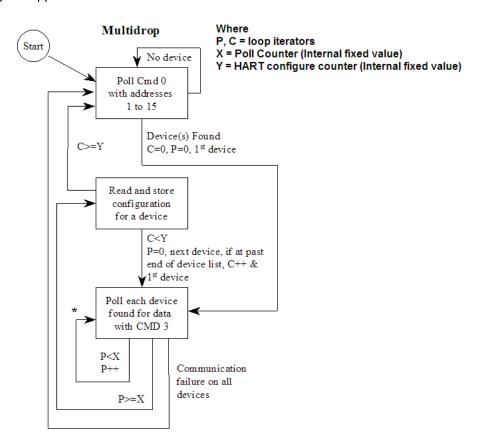

## **Multi-drop Mode**

**Important:** If the HART device address is between 1 and 15, you must configure the channel for multi-drop mode.

If the unit is set for multi-drop mode, the module will poll each unit attached to the channel starting with polling address 1. The parameter MAX DEVICE COUNT in the configuration determines the maximum slave address number to be polled in multi-drop mode. For example, if the MAX DEVICE COUNT parameter is set to 3, the channel will poll for polling addresses 1, 2, and 3. It is important when assigning the device polling addresses for instruments on a channel to start with 1 and successfully increase the value by one until the last instrument is assigned an address. If you set the MAX DEVICE COUNT parameter to 2, and assign the two instruments addresses 1 and 15, the polling address 15 will never be used (only addresses 1 and 2). Therefore, the second instrument will never be polled and will be in communication failure. Up to 15 instruments can be assigned to a single channel (polling address 1 to 15).

If the module is configured for multi-drop auto-polling (Auto-Poll Code = M), the following diagram applies:

\* - If user commands are ready to execute, issue them at this time.

In multi-drop mode, the channel will poll for instruments 1 to the value set in the MAX DEVICE COUNT parameter. For each device found, it will continuously poll for data using command 3. After a certain number of iterations, the HART Driver will ready the configuration data for the next device (if there is one). Each time configuration information is acquired, it will be for a different slave device if more than 1 slave is recognized by the channel. Less frequently, the channel will poll for devices not found in the original search of the network using HART command 0. If communications is lost with all devices, the module will try to establish communications with the devices using command 0. If user commands are present and enabled, they will be executed after the data polling of the devices.

#### Multi-drop Mode Example:

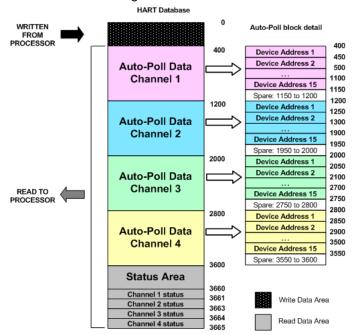

The intent is to show when using Multi-drop mode how the Auto-Poll DB Address and Max Device Count parameters should be used.

If the configuration file sets the following parameters:

Parameter	Value	Config File Section
DB Address Status	3660	
Auto-Poll DB Address	400	[HART PORT 0]
Max Device Count	15	

Parameter	Value	Config File Section	
DB Address Status	3661		
Auto-Poll DB Address	1200	[HART PORT 1]	
Max Device Count	15		
DB Address Status	3662		
Auto-Poll DB Address	2000	[HART PORT 2]	
Max Device Count	15		
DB Address Status	3663		
Auto-Poll DB Address	2800	[HART PORT 3]	
Max Device Count	15		

The HART database has the following structure.

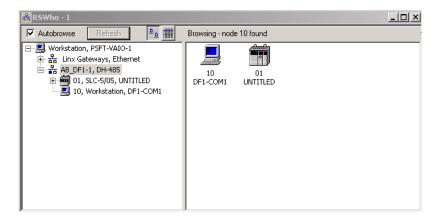

The configuration file for this example shows that when the MAX Device Address parameter is configured as 15, the module will reserve 750 words for each channel (15 devices x 50 words each) even though not all devices may be present on the network.

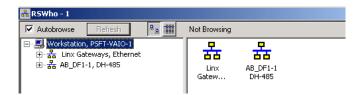

# 5.3 Disabling the RSLinx Driver for the Com Port on the PC

The communication port driver in *RSLinx* can occasionally prevent other applications from using the PC's COM port. If you are not able to connect to the module's configuration/debug port using *ProSoft Configuration Builder (PCB)*, *HyperTerminal* or another terminal emulator, follow these steps to disable the *RSLinx* driver.

- Open RSLinx and go to COMMUNICATIONS > RSWHO.
- 2 Make sure that you are not actively browsing using the driver that you wish to stop. The following shows an actively browsed network.

3 Notice how the DF1 driver is opened, and the driver is looking for a processor on node 1. If the network is being browsed, then you will not be able to stop this driver. To stop the driver your *RSWho* screen should look like this:

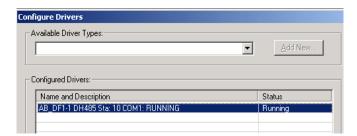

Branches are displayed or hidden by clicking on the 🖶 or the 🖃 icons.

When you have verified that the driver is not being browsed, go to **COMMUNICATIONS** > **CONFIGURE DRIVERS**.

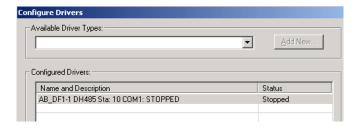

You may see something like this:

If you see the status as running, you will not be able to use this com port for anything other than communication to the processor. To stop the driver press the **STOP** button on the side of the window:

5 After you have stopped the driver you will see the following.

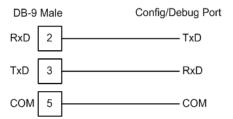

6 You may now use the comport to connect to the debug port of the module.

**Note:** You may need to shut down and restart your PC before it will allow you to stop the driver (usually only on *Windows NT* machines). If you have followed all of the above steps, and it will not stop the driver, then make sure you do not have *RSLogix* open. If *RSLogix* is not open, and you still cannot stop the driver, then reboot your PC.

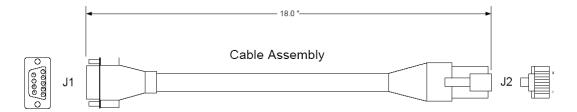

# 5.4 RS-232 Configuration/Debug Port

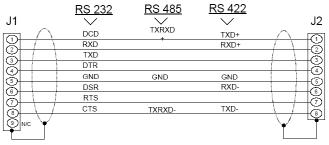

This port is physically an RJ45 connection. An RJ45 to DB-9 adapter cable is included with the module. This port permits a PC-based terminal emulation program to view configuration and status data in the module and to control the module. The cable pinout for communications on this port is shown in the following diagram.

RS-232 Config/Debug Port Cable

# 5.5 DB9 to RJ45 Adaptor (Cable 14)

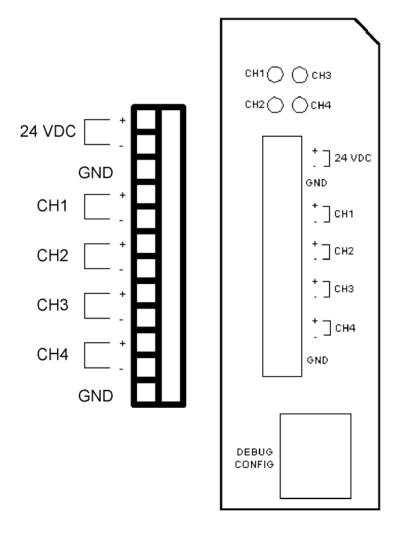

Wiring Diagram

# 5.6 Application Port Connection

The MVI56-HART module has a single terminal connector to attach the module to the HART networks. The following diagrams display the configuration of the terminal connector:

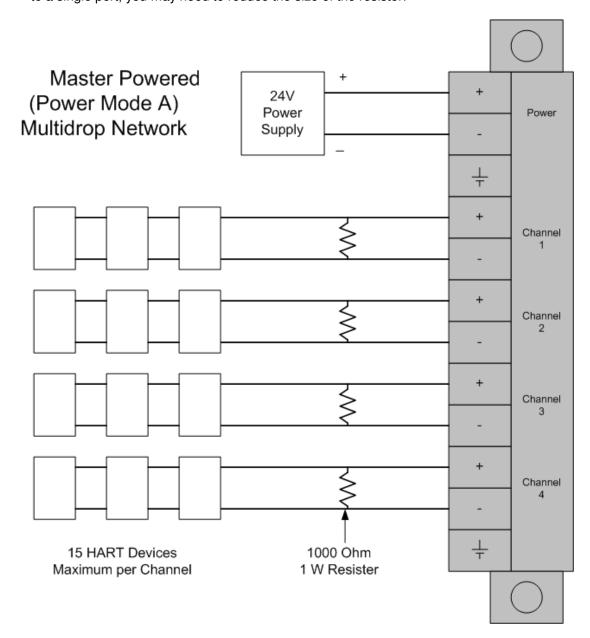

# **5.7 Example Field Terminations**

		Up to 15 instruments per channel	One instrument per channel		
		Multi-drop Mode (address 1 to 15)	Point to Point Mode (address 0 to 15)	Point to Point Mode with Analog (address 0 only)	
Power Mode A 24VDC connected to HART power terminals 1 and 2 on terminal block	Master Powered instruments on all 4 channels	OK Install 250□ 1K□	OK Install 1K resistor	OK	
Power Mode B HART power terminals 1 and 2 on terminal block left open	Loop Powered instruments on 1 or more channels	OK	OK	OK - differential or single ended analog signal	
	Self Powered instruments on 1 or more channels	Not possible	OK	OK -differential or single ended analog signal	

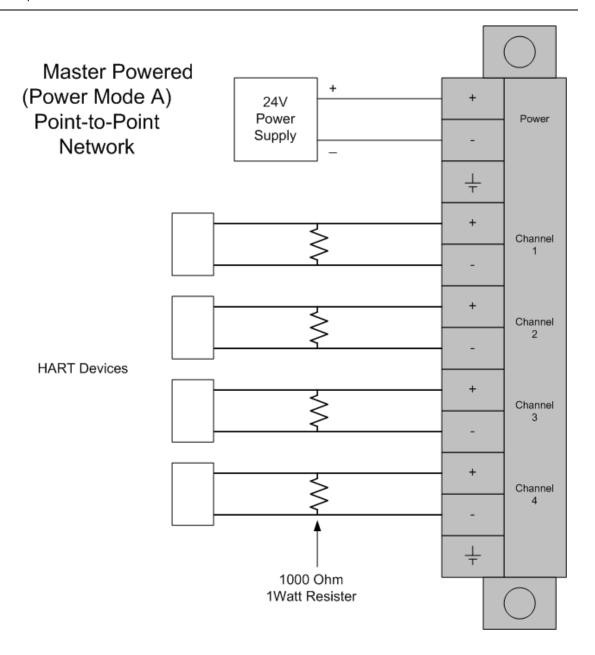

#### 5.7.1 Notes

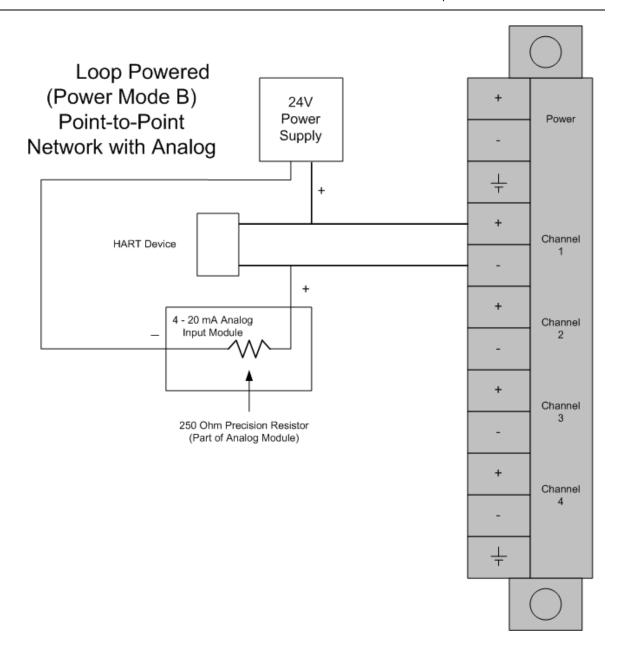

- 1 All four channels on the unit must be either Master Powered (Power Mode A) or must be Loop or Self powered (Power Mode B). You cannot mix Power Mode A and Power Mode B on the same unit. You can mix Loop powered and Self powered instruments on the same unit. However, you cannot mix Loop powered and Self powered instruments on the same channel.
- 2 For Master Powered, Multi-drop Mode and Point to Point Mode, a 1K, 1W resistor must be connected across the + and input terminals of each HART channel. Resistors are supplied with each product.
- When configuring loop powered instruments in a Power Mode B type multi-drop network, use only one power supply per HART channel if you wish to maintain channel to channel isolation. If channel to channel isolation is not required, the same power supply may be used for all four channels. However, a separate series resistor is required for each channel. An appropriately sized resistor must be connected in series with the power supply for each channel. The value and power rating of the resistor is dependant upon the number of instruments in the loop and the length and gauge of the pair of wires connecting the instruments to the unit. 250 Ohm, 3 Watt is a good, first choice value.
- 4 If field instrument wiring is shielded, terminate shields at the ground terminals of the HART connector. Do not terminate the shields at the instrument.

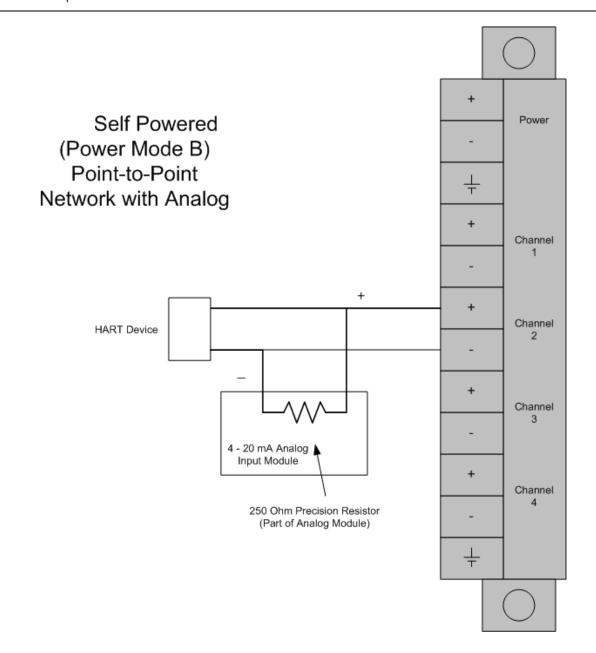

5 For multi-drop applications, the 1K□ resistor should be normally used when one transmitter is connected to the port. If you increase the number of devices connected to a single port, you may need to reduce the size of the resistor.

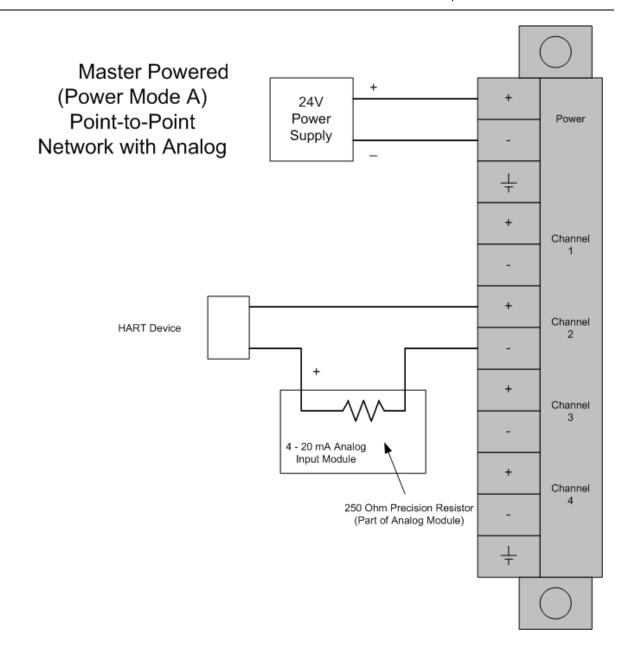

# 5.8 MVI56-HART Status Data and Error Codes

### 5.8.1 Error/Status Data Block

This block is generated with a Read Block ID 0 or -1.

Offset	Content	Description			
0	Reserved	Not used			
1	Write Block ID	Block identification code for block requested by the module.			
2	Program Scan Count	This value is incremented each time a complete program cycle occurs in the module.			
3 to 4	Product Code	These two registers contain the product code of "HRT5"			
5 to 6	Product Version	These two registers contain the product version for the currently running software.			
7 to 8	Operating System	These two registers contain the month and year values for the program operating system.			
9 to 10	Run Number	These two registers contain the run number value for the currently running software.			
11	Read Block Count	This field contains the total number of read blocks transferred from the module to the processor.			
12	Write Block Count	This field contains the total number of write blocks transferred from the processor to the module.			
13	Parse Block Count	This field contains the total number of blocks successfully parsed that were received from the processor.			
14	Reserved	Not used			
15	Command Block Count	This field contains the total number of command blocks received from the processor for enable and disable requests.			
16	Error Block Count	This field contains the total number of block errors recognized by the module.			
17	Channel 1 State	Channel 1 state machine value (used for debugging) 0 Polling 1 Config 2 Data Poll 3 User Poll 4 Wait Unique ID			
18	Comm State	Channel 1 communication state machine value (used for debugging)  0 Startup  1 Idle  2 Transmit Pending  3 Transmit  4 Receive  5 Post Transmit  6 Idle, Waiting			

Offset	Content	Description				
19	Device Status (bit mapped)	Each bit in this word corresponds to a slave address on the network starting at bit 1 for slave address 1. Bit 0 is not used. If the bit is set, the slave is in error. If the bit is clear (0), the slave is not in error.				
20	Device Poll List (bit mapped)	Each bit in this word corresponds to a slave address on the network starting at bit 1 for slave address 1. Bit 0 is not used. If the bit is set, the slave is in the poll list. If the bit is clear (0), the slave is not in the poll list.				
21	Device With Long Address (bit mapped)	Each bit in this word corresponds to a slave address on the network starting at bit 1 for slave address 1. Bit 0 is not used. If the bit is set, the slave uses the long address. If the bit is clear (0), the slave does not use the long address.				
22	Current Command	This field contains the index of the current command to execute.				
23	Command Request Count	This field contains the total number of request messages issued on the channel.				
24	Command Response Count	This field contains the total number of response messages received from devices on the network.				
25	Configuration Error Word	Configuration error word (see table)				
26	Current Error Code	Current error code for channel				
27	Last Error Code	Last error code reported for channel				
28	Channel 2 State	Channel 2 state machine value (used for debugging)  0 Polling  1 Config  2 Data Poll  3 User Poll  4 Wait Unique ID				
29	Comm State	Channel 2 communication state machine value (used for debugging)  0 Startup  1 Idle  2 Transmit Pending  3 Transmit  4 Receive  5 Post Transmit  6 Idle, Waiting				
30	Device Status (bit mapped)	Each bit in this word corresponds to a slave address on the network starting at bit 1 for slave address 1. Bit 0 is not used. If the bit is set, the slave is in error. If the bit is clear (0), the slave is not in error.				
31	Device Poll List (bit mapped)	Each bit in this word corresponds to a slave address on the network starting at bit 1 for slave address 1. Bit 0 is not used. If the bit is set, the slave is in the poll list. If the bit is clear (0), the slave is not in the poll list.				

Offset	Content	Description
32	Device With Long Address (bit mapped)	Each bit in this word corresponds to a slave address on the network starting at bit 1 for slave address 1. Bit 0 is not used. If the bit is set, the slave uses the long address. If the bit is clear (0), the slave does not use the long address.
33	Current Command	This field contains the index of the current command to execute.
34	Command Request Count	This field contains the total number of request messages issued on the channel.
35	Command Response Count	This field contains the total number of response messages received from devices on the network.
36	Configuration Error Word	Configuration error word (see table).
37	Current Error Code	Current error code for channel.
38	Last Error Code	Last error code reported for channel.
39	Channel 3 State	Channel 3 state machine value (used for debugging).  O Polling  Config  Data Poll  User Poll  Wait Unique ID
40	Comm State	Channel 3 communication state machine value (used for debugging).  0 Startup 1 Idle 2 Transmit Pending 3 Transmit 4 Receive 5 Post Transmit 6 Idle, Waiting
41	Device Status (bit mapped)	Each bit in this word corresponds to a slave address on the network starting at bit 1 for slave address 1. Bit 0 is not used. If the bit is set, the slave is in error. If the bit is clear (0), the slave is not in error.
42	Device Poll List (bit mapped)	Each bit in this word corresponds to a slave address on the network starting at bit 1 for slave address 1. Bit 0 is not used. If the bit is set, the slave is in the poll list. If the bit is clear (0), the slave is not in the poll list.
43	Device With Long Address (bit mapped)	Each bit in this word corresponds to a slave address on the network starting at bit 1 for slave address 1. Bit 0 is not used. If the bit is set, the slave uses the long address. If the bit is clear (0), the slave does not use the long address.
44	Current Command	This field contains the index of the current command to execute.
45	Command Request Count	This field contains the total number of request messages issued on the channel.
46	Command Response Count	This field contains the total number of response messages received from devices on the network.
47	Configuration Error Word	Configuration error word (see table).

Offset	Content	Description			
48	Current Error Code	Current error code for channel.			
49	Last Error Code	Last error code reported for channel.			
50	Channel 4 State	Channel 4 state machine value (used for debugging).  O Polling  Config  Data Poll  User Poll  Wait Unique ID			
51	Comm State	Channel 4 communication state machine value (used for debugging).  0 Startup  1 Idle  2 Transmit Pending  3 Transmit  4 Receive  5 Post Transmit  6 Idle, Waiting			
52	Device Status (bit mapped)	Each bit in this word corresponds to a slave address on the network starting at bit 1 for slave address 1. Bi 0 is not used. If the bit is set, the slave is in error. If the bit is clear (0), the slave is not in error.			
53	Device Poll List (bit mapped)	Each bit in this word corresponds to a slave address on the network starting at bit 1 for slave address 1. Bi 0 is not used. If the bit is set, the slave is in the poll list. If the bit is clear (0), the slave is not in the poll list			
54	Device With Long Address (bit mapped)	Each bit in this word corresponds to a slave address on the network starting at bit 1 for slave address 1. Bit 0 is not used. If the bit is set, the slave uses the long address. If the bit is clear (0), the slave does not use the long address.			
55	Current Command	This field contains the index of the current command to execute.			
56	Command Request Count	This field contains the total number of request messages issued on the channel.			
57	Command Response Count	This field contains the total number of response messages received from devices on the network.			
58	Configuration Error Word	Configuration error word (see table).			
59	Current Error Code	Current error code for channel.			
60	Last Error Code	Last error code reported for channel.			
61 to 248	Reserved	Not used.			
249	Read Block ID	Block identification code of 0 or -1 to indicate a status data block.			

### 5.8.2 Configuration Error Word

The following table defines the contents of the configuration error word. Each bit in the word corresponds to an error condition recognized when the module is configured. There is a separate word for each HART channel. This data is reported in the status data area previously defined.

Bit	Code	Description
0	0x0001	Enabled not set to Y or N
1	0x0002	Enable Handheld not set to Y or N
2	0x0004	Primary Master not set to Y or N
3	8000x0	Invalid Preambles (1 to 50)
4	0x0010	Invalid Short Address Retries (0 to 50)
5	0x0020	Invalid Long Address Retries (0 to 50)
6	0x0040	Invalid Retries After Error (0 to 50)
7	0x0080	Invalid Poll Time After Error (0 to 10000)
8	0x0100	Invalid DB Address Status
9	0x0200	Invalid Command Count
10	0x0400	Memory Error in allocating commands
11	0x0800	Memory Error in allocating command fixed data
12	0x1000	Memory Error in allocating TX/RX buffers
13	0x2000	HART Board not found
14	0x4000	Cannot initialize HART channel
15	0x8000	

Each command in the command list for each HART channel has a word value for a status/error code. This error data list can be read using the Configuration/Debug Port and can be placed in the module's internal database using the Error/Status Offset parameter for each port. Accessing the Debug capabilities of the module is accomplished by connecting a PC to the Debug port, then running a terminal emulation program. This status/error code is the first word of the Integer Data Block returned from every HART command executed. This word has information about the execution of the command by the HART device.

Refer to the following section for a listing of the Error Codes to interpret the status/error codes present in the integer data area. The following illustration shows the location of each error word in the data block:

Word Offset	Description
0	Command 0 Error Value
•••	
99	Command 99 Error Value

The module error codes are listed in this section. Error codes returned from the HART device are placed at the first word of the integer data block in the Virtual Database. The error codes are formatted in the word as follows:

If the most-significant bit of the word contains "1", then the most significant byte has a communication error code. The least-significant byte of the word will contain "0".

If the most-significant bit of the word contains "0", the most significant byte contains a command error code. In this case, the least-significant byte contains device malfunction information.

If this word value is "-1" (or 0xFFFF), it means that the command timed out.

Use the error codes returned for each command in the list to determine the success or failure of the command. If the command fails, use the error code to determine the cause of failure.

### 5.8.3 Protocol Error Codes

These are error codes that are part of the HART protocol. The standard HART error codes are shown in the tables below:

⊏r	ror	Cod	۵ ۱۸	Iord

	First Byte				Second Byte										
7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0

BIT	7 (	OF	FIRS	T BY	ΤE	= 1
CO	MΝ	IUN	IICA1	ΓΙΟΝ	ER	ROR

FIRST BYTE	
BIT 6	Parity Error
BIT 5	Overrun Error
BIT 4	Framing Error
BIT 3	Checksum Error
BIT 2	Reserved
BIT 1	RX Buffer Overflow
BIT 0	Undefined
SECOND BYTE	
BIT 0 to BIT 7	All 0

#### BIT 7 OF FIRST BYTE = 0 COMMAND ERROR

COMMAND ERROR	
FIRST BYTE	
Bits 6 to 0 (not bit-mapped):	
0	No Error
1	Undefined
2	Invalid Selection
3	Passed Parameter Too Large
4	Passed Parameter Too Small
5	Too Few Data Bytes Received
6	Transmitter-Specific Command Error
7	In Write-Protect Mode
8 to 15	Command Specific Errors (see Below)
16	Access Restricted
32	Device is Busy

BIT 7 OF FIRST BYTE = 0 COMMAND ERROR	
64	Command not Implemented
SECOND BYTE	
BIT 7	Device Malfunction
BIT 6	Configuration Changed
BIT 5	Cold Start
BIT 4	Unused
BIT 3	Output Current Fixed
BIT 2	Analog Output Saturated
BIT 1	Variable (Not Primary) Out of Limits
BIT 0	Primary Variable Out of Limits
COMMAND SPECIFIC ERRORS	
8	Update Failed
	Update In Progress
	Set to Nearest Possible Value
9	Applied Process Too High
	Lower Range Value Too High
	Not in Fixed Current Mode
10	Applied Process Too Low
	Lower Range Value Too Low
<del></del>	Multi-drop Not Supported
11	In Multi-drop Mode Invalid Transmitter Variable Code
	Upper Range Value Too High
12	Invalid Unit Code
14	Upper Range Value Too Low
13	Both Range Values Out of Limits
14	Pushed Upper Range Value Over Limit
	Span Too Small

### 5.9 HART Universal Commands

## **COMMAND 00 - Read Unique Identifier**

## **Description**

This command gets the long address of the HART device plus other manufacturer information like Manufacturer ID, Device Type Code, Software Revision, Hardware Revision, and so on.

### **Write Parameters**

NONE

### **Floating Point Data Returned**

NONE

Word	High Byte	Low Byte
0	STATUS WORD	
1	Constant "254"	Manufacturer Identification Code
2	Manufacturer Device Type Code	Number of Preambles
3	Universal Command Revision	Transmitter Specific Command Revision
4	Software Revision	Hardware Revision
5	Device Function Flags	Device ID Number 1
6	Device ID Number 2	Device ID Number 3

# **COMMAND 01 - Read Primary Variable**

### **Description**

This command gets the device Primary Variable and the Primary Variable Units

### **Write Parameters**

NONE

## **Floating Point Data Returned**

Word	High Byte	Low Byte	
0	Primary Variable Value		
1	<del>-</del>		

Word	High Byte	Low Byte
0	STATUS WORD	
1	Primary Variable Units Code	0

# **COMMAND 02 - Read Current And Percent Of Range**

### **Description**

This command gets the current of the loop that is forced by the HART device and the Percent of Range of the Current.

## **Write Parameters**

NONE

### **Floating Point Data Returned**

	•	
Word	High Byte	Low Byte
0	Current (mA)	
1	_	
2	Percent of Range	
3	_	

Word	High Byte	Low Byte
0	STATUS WORD	

# **COMMAND 03 - Read Dynamic Variables**

## **Description**

This command gets the current and four (predefined) dynamic Variables.

### **Write Parameters**

NONE

## **Floating Point Data Returned**

	9	
Word	High Byte	Low Byte
0	Current (mA)	
1	_	
2	Primary Variable	
3	<del>-</del>	
4	Second Variable	
5	_	
6	Third Variable	
7	_	
8	Fourth Variable	
9	_	

Word	High Byte	Low Byte
0	STATUS WORD	
1	Primary Variable Units Code	Second Variable Units Code
2	Third Variable Units Code	Fourth Variable Units Code

# **COMMAND 06 - Write Polling Address**

### **Description**

This command sets the polling address of a HART device. Extreme care should be taken when you use this command because you can loose the communication with the device.

### **Write Parameters**

Word	High Byte	Low Byte
0	Polling Address	Polling Address

## **Floating Point Data Returned**

NONE

Word	High Byte	Low Byte
0	STATUS WORD	
1	Polling Address	0

# **COMMAND 12 - Read Message**

### **Description**

This command reads an ASCII message contained in the HART Device and written by the Write Message command 17.

### **Write Parameters**

NONE

## **Floating Point Data Returned**

NONE

Word	High Byte	Low Byte
0	STATUS WORD	
1	Message ASCII Character 0 Message ASCII Character 1	
2	Message ASCII Character 2	Message ASCII Character 3
	•	
	•	
14	Message ASCII Character 28 Message ASCII Character 29	
15	Message ASCII Character 30	Message ASCII Character 31

# **COMMAND 13 - Read Tag, Descriptor and Date**

### **Description**

This command reads an ASCII Tag which identifies the device, an ASCII descriptor of the device and the last Date it has been configured.

### **Write Parameters**

NONE

## **Floating Point Data Returned**

NONE

Word	High Byte	Low Byte
0	STATUS WORD	
1	TAG ASCII Character 0	TAG ASCII Character 1
2	TAG ASCII Character 2	TAG ASCII Character 3
3	TAG ASCII Character 4	TAG ASCII Character 5
4	TAG ASCII Character 6	TAG ASCII Character 7
5	Descriptor ASCII Character 0	Message ASCII Character 1
12	Descriptor ASCII Character 14	Message ASCII Character 15
13	Date	Date
14	Date	0

## **COMMAND 14 - Read PV Sensor Info**

### **Description**

This command gets information about the Primary Variable sensor, like limits and span.

### **Write Parameters**

NONE

## **Floating Point Data Returned**

	•	
Word	High Byte	Low Byte
0	Upper Sensor Limit	
1	_	
2	Lower Sensor Limit	
3	_	
4	Minimum Span	
5	_	

Word	High Byte	Low Byte
0	STATUS WORD	
1	Sensor Serial Number 0	Sensor Serial Number 1
2	Sensor Serial Number 2	Unit Codes for Sensor Limits and Span

# **COMMAND 15 - Read Output Information**

### **Description**

This command gets information about the Primary Variable Output Information.

### **Write Parameters**

NONE

# **Floating Point Data Returned**

Word	High Byte	Low Byte
0	Upper Range Value	
1	_	
2	Lower Range Value	
3	_	
4	Damping Value (Sec)	
5	_	

Word	High Byte	Low Byte	
0	STATUS WORD		
1	Alarm Select Code	Transfer Function Code	
2	Primary Variable Range Units Code	Write-Protect Code	
2	Private-Label Distributor Code	0	

# **COMMAND 16 - Read Final Assembly Number**

### **Description**

This command reads the final assembly number of the HART device.

### **Write Parameters**

NONE

## **Floating Point Data Returned**

NONE

Word	High Byte	Low Byte
0	STATUS WORD	
1	Final Assembly Number 0	Final Assembly Number 1
2	Final Assembly Number 2	0

# **COMMAND 17 - Write Message**

## **Description**

This command writes an ASCII message contained in the HART Device and that can be read with command 12.

### **Write Parameters**

Word	High Byte	Low Byte
0	Packed ASCII Message Byte 0	Packed ASCII Message Byte 1
1	Packed ASCII Message Byte 2	Packed ASCII Message Byte 3
	•	
11	Packed ASCII Message Byte 22	Packed ASCII Message Byte 23

## **Floating Point Data Returned**

NONE

Word	High Byte	Low Byte
0	STATUS WORD	

# **COMMAND 18 - Write Tag, Descriptor and Date**

### **Description**

This command writes an ASCII Tag which identifies the device, an ASCII descriptor of the device and the last Date it has been configured.

### **Write Parameters**

Word	High Byte	Low Byte
0	Packed ASCII TAG Byte 0	Packed ASCII TAG Byte 1
1	Packed ASCII TAG Byte 2	Packed ASCII TAG Byte 3
2	Packed ASCII TAG Byte 4	Packed ASCII TAG Byte 5
3	Packed ASCII Descriptor Byte 0	Packed ASCII Descriptor Byte 1
	•	
8	Packed ASCII Descriptor Byte 10	Packed ASCII Descriptor Byte 11
9	Date	Date
10	Date	0

## **Floating Point Data Returned**

NONE

Word	High Byte	Low Byte
0	STATUS WORD	
1	TAG ASCII Character 0	TAG ASCII Character 1
2	TAG ASCII Character 2	TAG ASCII Character 3
3	TAG ASCII Character 4	TAG ASCII Character 5
4	TAG ASCII Character 6	TAG ASCII Character 7
5	Descriptor ASCII Character 0	Message ASCII Character 1
	•	
12	Descriptor ASCII Character 14	Message ASCII Character 15
13	Date	Date
14	Date	0

# **COMMAND 19 - Write Final Assembly Number**

### **Description**

This command writes the final assembly number of the HART device.

### **Write Parameters**

Word	High Byte	Low Byte
0	Final Assembly Number 0	Final Assembly Number 1
1	Final Assembly Number 2	Final Assembly Number 2

## Floating Point Data Returned:

NONE

Word	High Byte	Low Byte
0	STATUS WORD	
1	Final Assembly Number 0	Final Assembly Number 1
2	Final Assembly Number 2	0

### 5.10 HART Common Practice Commands

### **COMMAND 33 - Read Transmitter Variables**

## **Description**

This command gets four user selected dynamic Variables.

### **Write Parameters**

Word	High Byte	Low Byte
0	Transmitter Variable Code For Slot 0	Transmitter Variable Code For Slot 1
1	Transmitter Variable Code For Slot 2	Transmitter Variable Code For Slot 3

### **Floating Point Data Returned**

Word	High Byte	Low Byte
0	Variable for Slot 0	
1	_	
2	Variable for Slot 0	
3	_	
4	Variable for Slot 2	
5	_	
6	Variable for Slot 3	
7	_	

Word	High Byte	Low Byte
0	STATUS WORD	
1	Transmitter Variable Code For Slot 0	Units Code for Slot 0 Variable
2	Transmitter Variable Code For Slot 1	Units Code for Slot 1 Variable
3	Transmitter Variable Code For Slot 2	Units Code for Slot 2 Variable
4	Transmitter Variable Code For Slot 3	Units Code for Slot 3 Variable

# **COMMAND 34 - Write Damping Value**

### **Description**

This command writes the damping value of a HART device.

### **Write Parameters**

Word	High Byte	Low Byte
0	Floating Point Damping Value (Sec)	
1		

# **Floating Point Data Returned**

Word	High Byte	Low Byte
0	Floating Point Damping Value (Sec)	
1	_	

Word	High Byte	Low Byte
0	STATUS WORD	

# **COMMAND 35 - Write Range Values**

### **Description**

This command writes the Upper and Lower range of the Primary Variable

### **Write Parameters**

Word	High Byte	Low Byte
0	Range Units Code	Floating Point Upper Range Value (Byte 0)
1	Floating Point Upper Range Value (Byte 1)	Floating Point Upper Range Value (Byte 2)
2	Floating Point Upper Range Value (Byte 3)	Floating Point Lower Range Value (Byte 0)
3	Floating Point Lower Range Value (Byte 1)	Floating Point Lower Range Value (Byte 2)
4	Floating Point Lower Range Value (Byte 3)	Floating Point Lower Range Value (Byte 3)

## **Floating Point Data Returned**

Word	High Byte	Low Byte
0	Upper Range Value	
1		
2	Lower Range Value	
3	-	

Word	High Byte	Low Byte
0	STATUS WORD	
1	Range Units Code	0

# **COMMAND 36 - Set Upper Range Value**

### **Description**

This command is similar in effect to push the SPAN button of the HART device but doing it remotely through the HART network.

### **Write Parameters**

NONE

## **Floating Point Data Returned**

NONE

Word	High Byte	Low Byte
0	STATUS WORD	

# **COMMAND 37 - Set Lower Range Value**

## **Description**

This command is similar in effect to push the ZERO button of the HART device but doing it remotely through the HART network.

#### **Write Parameters**

**NONE** 

### **Floating Point Data Returned**

NONE

Word	High Byte	Low Byte
0	STATUS WORD	

# **COMMAND 38 - Reset Configuration Changed Flag**

### **Description**

This command resets the status bit that indicates that configuration has been changed.

### **Write Parameters**

NONE

## **Floating Point Data Returned**

NONE

Word	High Byte	Low Byte
0	STATUS WORD	

## **COMMAND 39 - EEPROM Control**

### **Description**

This command operates over the EEPROM changing its settings.

### **Write Parameters**

Word	High Byte	Low Byte
0	EEPROM Control Code	EEPROM Control Code

## **Floating Point Data Returned**

# 6 Support, Service & Warranty

#### In This Chapter

*	Contacting Technical Support	161
*	Return Material Authorization (RMA) Policies and Conditions	163
*	I IMITED WARRANTY	165

#### **Contacting Technical Support**

ProSoft Technology, Inc. (ProSoft) is committed to providing the most efficient and effective support possible. Before calling, please gather the following information to assist in expediting this process:

- 1 Product Version Number
- 2 System architecture
- 3 Network details

If the issue is hardware related, we will also need information regarding:

- 1 Module configuration and associated ladder files, if any
- 2 Module operation and any unusual behavior
- 3 Configuration/Debug status information
- 4 LED patterns
- 5 Details about the serial, Ethernet or fieldbus devices interfaced to the module, if any.

**Note:** For technical support calls within the United States, an after-hours answering system allows 24-hour/7-days-a-week pager access to one of our qualified Technical and/or Application Support Engineers. Detailed contact information for all our worldwide locations is available on the following page.

#### 6.1 Return Material Authorization (RMA) Policies and Conditions

The following Return Material Authorization (RMA) Policies and Conditions (collectively, "RMA Policies") apply to any returned product. These RMA Policies are subject to change by ProSoft Technology, Inc., without notice. For warranty information, see Limited Warranty (page 165). In the event of any inconsistency between the RMA Policies and the Warranty, the Warranty shall govern.

#### 6.1.1 Returning Any Product

- a) In order to return a Product for repair, exchange, or otherwise, the Customer must obtain a Return Material Authorization (RMA) number from ProSoft Technology and comply with ProSoft Technology shipping instructions.
- b) In the event that the Customer experiences a problem with the Product for any reason, Customer should contact ProSoft Technical Support at one of the telephone numbers listed above (page 161). A Technical Support Engineer will request that you perform several tests in an attempt to isolate the problem. If after completing these tests, the Product is found to be the source of the problem, we will issue an RMA.
- c) All returned Products must be shipped freight prepaid, in the original shipping container or equivalent, to the location specified by ProSoft Technology, and be accompanied by proof of purchase and receipt date. The RMA number is to be prominently marked on the outside of the shipping box. Customer agrees to insure the Product or assume the risk of loss or damage in transit. Products shipped to ProSoft Technology using a shipment method other than that specified by ProSoft Technology, or shipped without an RMA number will be returned to the Customer, freight collect. Contact ProSoft Technical Support for further information.
- d) A 10% restocking fee applies to all warranty credit returns, whereby a Customer has an application change, ordered too many, does not need, etc. Returns for credit require that all accessory parts included in the original box (i.e.; antennas, cables) be returned. Failure to return these items will result in a deduction from the total credit due for each missing item.

#### 6.1.2 Returning Units Under Warranty

A Technical Support Engineer must approve the return of Product under ProSoft Technology's Warranty:

- a) A replacement module will be shipped and invoiced. A purchase order will be required.
- b) Credit for a product under warranty will be issued upon receipt of authorized product by ProSoft Technology at designated location referenced on the Return Material Authorization
  - If a defect is found and is determined to be customer generated, or if the defect is otherwise not covered by ProSoft Technology s warranty, there will be no credit given. Customer will be contacted and can request module be returned at their expense;
  - ii. If defect is customer generated and is repairable, customer can authorize ProSoft Technology to repair the unit by providing a purchase order for 30% of the current list price plus freight charges, duties and taxes as applicable.

#### 6.1.3 Returning Units Out of Warranty

- a) Customer sends unit in for evaluation to location specified by ProSoft Technology, freight prepaid.
- b) If no defect is found, Customer will be charged the equivalent of \$100 USD, plus freight charges, duties and taxes as applicable. A new purchase order will be required.
- c) If unit is repaired, charge to Customer will be 30% of current list price (USD) plus freight charges, duties and taxes as applicable. A new purchase order will be required or authorization to use the purchase order submitted for evaluation fee.

#### The following is a list of non-repairable units:

ScanPort Adapters

- o 1500 All
- 1550 Can be repaired only if defect is the power supply
- 1560 Can be repaired only if defect is the power supply

#### inRAx Modules

- o 3150 All
- 3170 All
- o **3250**
- o **3300**
- o **3350**
- o 3600 All
- o 3700
- o **3750**
- o 3800-MNET

#### **ProLinx Standalone Gateways**

4xxx - All (No hardware available to do repairs)

#### 6.2 LIMITED WARRANTY

This Limited Warranty ("Warranty") governs all sales of hardware, software, and other products (collectively, "Product") manufactured and/or offered for sale by ProSoft Technology, Incorporated (ProSoft), and all related services provided by ProSoft, including maintenance, repair, warranty exchange, and service programs (collectively, "Services"). By purchasing or using the Product or Services, the individual or entity purchasing or using the Product or Services ("Customer") agrees to all of the terms and provisions (collectively, the "Terms") of this Limited Warranty. All sales of software or other intellectual property are, in addition, subject to any license agreement accompanying such software or other intellectual property.

#### 6.2.1 What Is Covered By This Warranty

- Warranty On New Products: ProSoft warrants, to the original purchaser, that the Product that is the subject of the sale will (1) conform to and perform in accordance with published specifications prepared, approved and issued by ProSoft, and (2) will be free from defects in material or workmanship; provided these warranties only cover Product that is sold as new. This Warranty expires three (3) years from the date of shipment for Product purchased on or after January 1st, 2008, or one (1) year from the date of shipment for Product purchased before January 1st, 2008 (the "Warranty Period"). If the Customer discovers within the Warranty Period a failure of the Product to conform to specifications, or a defect in material or workmanship of the Product, the Customer must promptly notify ProSoft by fax, email or telephone. In no event may that notification be received by ProSoft later than 39 months from date of original shipment. Within a reasonable time after notification, ProSoft will correct any failure of the Product to conform to specifications or any defect in material or workmanship of the Product, with either new or remanufactured replacement parts. ProSoft reserves the right, and at its sole discretion, may replace unrepairable units with new or remanufactured equipment. All replacement units will be covered under warranty for the 3 year period commencing from the date of original equipment purchase, not the date of shipment of the replacement unit. Such repair, including both parts and labor, will be performed at ProSoft's expense. All warranty service will be performed at service centers designated by ProSoft.
- b) Warranty On Services: Materials and labor performed by ProSoft to repair a verified malfunction or defect are warranteed in the terms specified above for new Product, provided said warranty will be for the period remaining on the original new equipment warranty or, if the original warranty is no longer in effect, for a period of 90 days from the date of repair.

#### 6.2.2 What Is Not Covered By This Warranty

- a) ProSoft makes no representation or warranty, expressed or implied, that the operation of software purchased from ProSoft will be uninterrupted or error free or that the functions contained in the software will meet or satisfy the purchaser's intended use or requirements; the Customer assumes complete responsibility for decisions made or actions taken based on information obtained using ProSoft software.
- b) This Warranty does not cover the failure of the Product to perform specified functions, or any other non-conformance, defects, losses or damages caused by or attributable to any of the following: (i) shipping; (ii) improper installation or other failure of Customer to adhere to ProSoft's specifications or instructions; (iii) unauthorized repair or maintenance; (iv) attachments, equipment, options, parts, software, or user-created programming (including, but not limited to, programs developed with any IEC 61131-3, "C" or any variant of "C" programming languages) not furnished by ProSoft; (v) use of the Product for purposes other than those for which it was designed; (vi) any other abuse, misapplication, neglect or misuse by the Customer; (vii) accident, improper testing or causes external to the Product such as, but not limited to, exposure to extremes of temperature or humidity, power failure or power surges; or (viii) disasters such as fire, flood, earthquake, wind and lightning.
- c) The information in this Agreement is subject to change without notice. ProSoft shall not be liable for technical or editorial errors or omissions made herein; nor for incidental or consequential damages resulting from the furnishing, performance or use of this material. The user guide included with your original product purchase from ProSoft contains information protected by copyright. No part of the guide may be duplicated or reproduced in any form without prior written consent from ProSoft.

#### 6.2.3 Disclaimer Regarding High Risk Activities

Product manufactured or supplied by ProSoft is not fault tolerant and is not designed, manufactured or intended for use in hazardous environments requiring fail-safe performance including and without limitation: the operation of nuclear facilities, aircraft navigation of communication systems, air traffic control, direct life support machines or weapons systems in which the failure of the product could lead directly or indirectly to death, personal injury or severe physical or environmental damage (collectively, "high risk activities"). ProSoft specifically disclaims any express or implied warranty of fitness for high risk activities.

#### 6.2.4 Intellectual Property Indemnity

Buyer shall indemnify and hold harmless ProSoft and its employees from and against all liabilities, losses, claims, costs and expenses (including attorney's fees and expenses) related to any claim, investigation, litigation or proceeding (whether or not ProSoft is a party) which arises or is alleged to arise from Buyer's acts or omissions under these Terms or in any way with respect to the Products. Without limiting the foregoing, Buyer (at its own expense) shall indemnify and hold harmless ProSoft and defend or settle any action brought against such Companies to the extent based on a claim that any Product made to Buyer specifications infringed intellectual property rights of another party. ProSoft makes no warranty that the product is or will be delivered free of any person's claiming of patent, trademark, or similar infringement. The Buyer assumes all risks (including the risk of suit) that the product or any use of the product will infringe existing or subsequently issued patents, trademarks, or copyrights.

- a) Any documentation included with Product purchased from ProSoft is protected by copyright and may not be duplicated or reproduced in any form without prior written consent from ProSoft.
- b) ProSoft's technical specifications and documentation that are included with the Product are subject to editing and modification without notice.
- c) Transfer of title shall not operate to convey to Customer any right to make, or have made, any Product supplied by ProSoft.
- d) Customer is granted no right or license to use any software or other intellectual property in any manner or for any purpose not expressly permitted by any license agreement accompanying such software or other intellectual property.
- e) Customer agrees that it shall not, and shall not authorize others to, copy software provided by ProSoft (except as expressly permitted in any license agreement accompanying such software); transfer software to a third party separately from the Product; modify, alter, translate, decode, decompile, disassemble, reverse-engineer or otherwise attempt to derive the source code of the software or create derivative works based on the software; export the software or underlying technology in contravention of applicable US and international export laws and regulations; or use the software other than as authorized in connection with use of Product.

# f) Additional Restrictions Relating To Software And Other Intellectual Property

In addition to compliance with the Terms of this Warranty, Customers purchasing software or other intellectual property shall comply with any license agreement accompanying such software or other intellectual property. Failure to do so may void this Warranty with respect to such software and/or other intellectual property.

#### 6.2.5 Disclaimer of all Other Warranties

The Warranty set forth in What Is Covered By This Warranty (page 165) are in lieu of all other warranties, express or implied, including but not limited to the implied warranties of merchantability and fitness for a particular purpose.

#### 6.2.6 Limitation of Remedies \*\*

In no event will ProSoft or its Dealer be liable for any special, incidental or consequential damages based on breach of warranty, breach of contract, negligence, strict tort or any other legal theory. Damages that ProSoft or its Dealer will not be responsible for include, but are not limited to: Loss of profits; loss of savings or revenue; loss of use of the product or any associated equipment; loss of data; cost of capital; cost of any substitute equipment, facilities, or services; downtime; the claims of third parties including, customers of the Purchaser; and, injury to property.

\*\* Some areas do not allow time limitations on an implied warranty, or allow the exclusion or limitation of incidental or consequential damages. In such areas, the above limitations may not apply. This Warranty gives you specific legal rights, and you may also have other rights which vary from place to place.

#### 6.2.7 Time Limit for Bringing Suit

Any action for breach of warranty must be commenced within 39 months following shipment of the Product.

#### 6.2.8 No Other Warranties

Unless modified in writing and signed by both parties, this Warranty is understood to be the complete and exclusive agreement between the parties, suspending all oral or written prior agreements and all other communications between the parties relating to the subject matter of this Warranty, including statements made by salesperson. No employee of ProSoft or any other party is authorized to make any warranty in addition to those made in this Warranty. The Customer is warned, therefore, to check this Warranty carefully to see that it correctly reflects those terms that are important to the Customer.

#### 6.2.9 Allocation of Risks

This Warranty allocates the risk of product failure between ProSoft and the Customer. This allocation is recognized by both parties and is reflected in the price of the goods. The Customer acknowledges that it has read this Warranty, understands it, and is bound by its Terms.

#### 6.2.10 Controlling Law and Severability

This Warranty shall be governed by and construed in accordance with the laws of the United States and the domestic laws of the State of California, without reference to its conflicts of law provisions. If for any reason a court of competent jurisdiction finds any provisions of this Warranty, or a portion thereof, to be unenforceable, that provision shall be enforced to the maximum extent permissible and the remainder of this Warranty shall remain in full force and effect. Any cause of action with respect to the Product or Services must be instituted in a court of competent jurisdiction in the State of California.
